How the Chinese Government Fabricates Social Media Posts for Strategic Distraction, not Engaged Argument*

Gary King†  Jennifer Pan‡  Margaret E. Roberts§

April 9, 2017

Abstract

The Chinese government has long been suspected of hiring as many as 2,000,000 people to surreptitiously insert huge numbers of pseudonymous and other deceptive writings into the stream of real social media posts, as if they were the genuine opinions of ordinary people. Many academics, and most journalists and activists, claim that these so-called “50c party” posts vociferously argue for the government’s side in political and policy debates. As we show, this is also true of the vast majority of posts openly accused on social media of being 50c. Yet, almost no systematic empirical evidence exists for this claim, or, more importantly, for the Chinese regime’s strategic objective in pursuing this activity. In the first large scale empirical analysis of this operation, we show how to identify the secretive authors of these posts, the posts written by them, and their content. We estimate that the government fabricates and posts about 448 million social media comments a year. In contrast to prior claims, we show that the Chinese regime’s strategy is to avoid arguing with skeptics of the party and the government, and to not even discuss controversial issues. We show that the goal of this massive secretive operation is instead to distract the public and change the subject, as most of these posts involve cheerleading for China, the revolutionary history of the Communist Party, or other symbols of the regime. We discuss how these results fit with what is known about the Chinese censorship program, and suggest how they may change our broader theoretical understanding of “common knowledge” and information control in authoritarian regimes.

*Our thanks to Neel Guha, Peter Dyrud, Yingjie Fan, and many others for superb research assistance; Danielle Allen, Peter Bol, Becky Fair, Chase Harrison, Iain Johnston, Franziska Keller, Blake Miller, Jean Oi, Samantha Ravich, Brandon Stewart, Daniela Stockmann, Andy Walder, Yuhua Wang, Chaodan Zheng, and Yun Zhu for helpful comments; and DARPA (contract W31P4Q-13-C-0055/983-3) and the National Science Foundation (grant 1500086) for research support. Authors are listed alphabetically. Data and information necessary to replicate the results in this article appear in (King, Pan, and Roberts, 2017).

1 Introduction

Social media in China appears as vibrant and extensive as in any Western country, with more than 1,300 social media companies and websites, and millions of posts authored every day by people all over the country. At the same time, the Chinese regime imposes extensive and varied controls over of the entire system (Brady, 2009; Cairns and Carlson, 2016; Knockel et al., 2015; MacKinnon, 2012; Jason Q. Ng, 2015; Shirk, 2011; Stockmann, 2013; Stockmann and Gallagher, 2011; G. Yang, 2009). Which social media companies are prevented from operating in China is easy to see (the so-called “Great Firewall of China”), and the scholarly literature now offers considerable evidence on how and why they censor certain individual social media posts that have appeared on the web or filter them out before appearing. In both cases, the censorship apparatus allows a great deal of criticism of the regime, its officials, and their policies (which can be useful information for the central government in managing local leaders) but stops discussions that can generate collective action on the ground (King, Pan, and Roberts, 2013, 2014).¹

According to numerous speculations by scholars, activists, journalists, officials in other governments, and participants in social media, the Chinese regime also conducts “astroturfing,” or what we might call “reverse censorship,” surreptitiously posting large numbers of fabricated social media comments, as if they were the genuine opinions of ordinary Chinese people. The people hired for this purpose are known formally as “Internet commentators” (网络评论员) but more widely as “50c party” members (五毛党), so-called because they are rumored to be paid 50 cents (5 jiao, 角, or about US$0.08) to write and post each comment (Tong and Lei, 2013). Although we show that this rumor turns out to be incorrect, we adopt this widely used term to denote social media comments posted at the direction or behest of the regime, as if they were the opinions of ordinary people.²

¹While we make general statements about Chinese censorship, it is important to note that censorship in China is by no means monolithic in its operations or outcomes. Censorship is largely carried out by internet content providers, and regulations over the flow of information continues to evolve. As a result, there is variation in the precise details of censorship in China by platform, geography, and over time.
²Thus, 50c party members are distinct from “volunteer 50c members” (自干五; known as “bring your own grainers”), who express pro-regime or anti-western sentiment online without being paid by the government, the “little red flowers” (小粉红), an unpaid red guard who also attack opponents of the regime online,
The nearly unanimous view of journalists (and human rights activists) is that 50c party posts strongly argue with and debate against those who criticize the government, its leaders, and their policies. This is also the view of many scholarly publications discussing this activity (and was our view as well, prior to the research reported here). In Section 2, we systematically summarize these views, including a quantitative analysis of social media posts openly accused of being written by 50c party members. Unfortunately, until now, no method has existed for detecting 50c party members, which posts they write, their content, the size of the operation, or why they write them, and so the best anyone could do was to base claims on intuition, logic, occasional anecdotes, rumors, and leaked government directives.

In this article, we offer the first systematic empirical evidence for the content of 50c party posts, their authors, and the government’s strategic objectives. We begin by analyzing an archive of emails leaked from the Internet Propaganda Office of Zhanggong, a district of Ganzhou City in Jiangxi province (Section 3). These emails give explicit details of the work of numerous 50c accounts in this district. Although in the public domain and reported on in the press (e.g., Henochowicz, 2014; Sonnad, 2014), the structure of the archive is complicated, too large to understand by traditional qualitative methods, and in formats (and attachments) far too diverse to make standard methods of automation feasible; as such, it has never before been systematically analyzed, and little of it has been explored. We have developed an approach to analyze this data set and, from it, have extracted more than 43,000 known 50c party posts and their authors.

We first characterize the patterns in these data via their network and time series structures. Then, in Section 4, we systematically analyze the content of the 50c posts in our leaked archive and, in stages, extrapolate to the rest of China. We then use this methodology to study the content of the posts and finally infer the goals behind this massive

The “American Cent Party” (美分党) who express western democratic values and criticize the Chinese communist regime online, and the “internet water army” (网络水军), which refers to for-hire astroturfers working for and advancing the interests of companies and other actors willing to pay their fees. None are known to be organized groups. Of course, political parties do not exist in China and so, despite the name, the “50c Party” is not a political party. For an excellent overview of the purpose and tactics of the volunteer 50c party, see Han (2015a)

3Because China is a single-party regime, we use the terms “government” and “regime” interchangeably to refer to those in power.
government program and how it may reveal broader government strategies. We validate our 50c party member predictions in Section 5 with a novel sample survey of predicted 50c party members, as well as several unusual gold standard evaluations we develop to validate our validation. In Section 6, we estimate and reveal the size of what turns out to be a massive government operation that writes approximately 448 million 50c posts a year. Section 7 discusses our assumptions, interpretations, and what might go wrong with our evidence and inferences.

At every stage, our results indicate that prevailing views about the 50c party are largely incorrect. We show that almost none of the Chinese government’s 50c party posts engage in debate or argument of any kind. They do not step up to defend the government, its leaders, and their policies from criticism, no matter how vitriolic; indeed, they seem to avoid controversial issues entirely. Instead, most 50c posts are about cheerleading and positive discussions of valence issues. We also detect a high level of coordination in the timing and content in these posts. A theory consistent with these patterns is that the strategic objective of the regime is to distract and redirect public attention from discussions or events with collective action potential.

Section 8 discusses the theoretical implications of our findings. We give a unified parsimonious summary of Chinese government internal information control and show how these findings may cause scholars to rethink the notion of “common knowledge” in theories of authoritarian politics more generally. Section 9 concludes and then gives a summary of what we might have missed and how scholars can follow up on this work.4

2 What We Think We Know

We summarize here views about the 50c party of (1) journalists, (2) academics, and (3) social media participants accusing others of being 50c party members. The dominant view of most is that 50c party members engage in “hand-to-hand” verbal combat, making

---

4 Appendix B briefly describes the (unintended) events and implications of the Chinese government’s unexpected decision to respond to an early version of this article through an editorial in a state-owned newspaper. In so doing, they appear to give a rare admission of the existence of the 50c party; they also provide confirmation of our empirical results, inferences about government strategy, and substantive conclusions. (Our online Supplementary Appendix provides additional details and a translation of the original editorial.)
specific, directed arguments that support the government, its leaders, and their policies, and opposing arguments to the contrary; they do this by engaging in debate with and criticism of China’s enemies, including those who oppose it inside the country and from abroad. For (1) and (2), we offer brief literature reviews; for (3), we find and analyze posts accused by others of being 50c. In that section, we also introduce and validate a scheme to categorize 50c posts on the web; we use it in this section to understand the posts accused of being written by 50c members and then for many other purposes throughout this article.

Although the difficulties of collecting data on an inherently secret operation means that most prior literature includes “no successful attempts to quantify regime-sponsored commentary in China” (Miller, 2016), the work cited in this section involves considerable effort and creativity, and even a few clever efforts to guess what might be 50c posts before turning to try to explain or predict the guesses (Han, 2015b; Miller, 2016). For example, Han (2015b) uses information from leaked censorship directives and local media reports of the training of online commentators in an online “guerrilla ethnography.” Still, the lack of ground truth means that for identification of 50c posts, Han has to rely on anecdotal evidence and intuition (such as whether posts “smell strongly of official propaganda”). In other works, sophisticated unsupervised statistical techniques have been used but still generated “no evidence of large-scale Wumao [50c] activity on Weibo” (X. Yang, Q. Yang, and Wilson, 2015). As these authors make clear, little solid empirical evidence exists about the content and extent of 50c party posts.

1. Journalists  The popular press describes 50c members as “undercover pro-government Internet commenters” (Keating, 2011) who “set out to neutralize undesirable public opinion by pushing pro-Party views through chat rooms and Web forums” (Bandurski, 2008). They “shape online public opinion” by labeling “critical opinion leaders as traitors of the country” (O. Lam, 2012). Prominent dissident Ai Weiwei said “If you oppose the US and Japan [online], you are a member of the 50 cents army” (Strafella and Berg, 2015). 50c party members “combat hostile energy,” defined as posts that “go against socialist core values,” or “are not amenable to the unity of the people.” Such information should be “resolutely resisted, proactively refuted, and eagerly reported to Internet authorities.”
(Haley, 2010). Through active engagement of opposition views, they try to “sway public opinion” (Editors, 2016; Jason Ng, 2011), “influence public opinion…pretending to be ordinary citizens and defending or promoting the government’s point of view” (O. Lam, 2013), or “steer conversations in the right direction” (Editors, 2013). Estimates by journalists of the size of the 50c party is between 500,000 to 2 million (Philipp, 2015).

2. Academics  Academics have indicated that between 250,000 and 300,000 paid 50c party members write pseudonymous posts directed by the Chinese government (Barr, 2012; Freedom House, 2009; Greitens, 2013). Because of the absence of systematic scholarly research on the subject, academics express a wider range of possibilities (and uncertainties) for what 50c party members write about. However, in most cases, their conclusions mirror those of the journalists, that 50c party members generate pro-regime commentary and argue with its critics. (Deibert and Rohozinski, 2010) describe 50c party members who “patrol chatrooms and online forums, posting information favorable to the regime and chastising its critics”. They “mix control and activism on line…making favorable comments, and generally pushing discussion toward pro-Party lines” (Greitens, 2013). They are an “army of online commentators…promoting the Chinese Communist Party’s line on sensitive subjects” (Bremmer 2010, see also Hassid 2012). They “facilitate state propaganda and defuse crises” (Han, 2015b), “post comments favorable towards the government policies” (Tang, Jorba, and Jensen, 2012), “defending the government” and “fighting” those who “criticize the government” (Zhang, DiFranzo, and Hendler, 2014, p.1889), and, for example, “attack calls for the country to launch a ‘jasmine revolution’” (Bambauer, 2013, p.10).

3. Social Media Participants  Participants in social media regularly characterize 50c party members by openly accusing others of being members themselves. To systematically characterize their views, we obtained a random sample of 9,911 social media posts from 2010 to 2015 that contain the word “五毛党” (“50c party”). From these data, we drew a sample of 128 posts written by people accused in other posts of being 50c party members.
We then sorted these “accused 50c posts” into one of six categories, using a categorization scheme we will use throughout this article. With two independent Chinese language coders, and 200 randomly selected posts, we measured the inter-coder reliability of the categorization scheme at 93% agreement (see the Appendix A for details). Two of the categories, comprising 65% of the accused 50c posts, represent the views of academics and journalists, and include (1) Taunting of Foreign countries (which is 29% of this sample) and (2) Argumentative praise or criticism (36% of the sample). Taunting includes favorable comparisons of China compared to other, usually Western, countries and taunting of pro-democracy or pro-West values or opinions. Argumentative praise or criticism involves engaged argument and debate about controversial (non-valence) issues, criticism of opponents of the government, or praise of the leaders.

The categorization scheme also includes (3) Non-argumentative praise or suggestions (22% of the sample) and two categories that everyone agrees are not what 50c party members are writing about, (4) factual Reporting (8%) and (5) Cheerleading (at 5%). Non-argumentative praise or suggestions includes discussion of noncontroversial valence issues, such as improving housing or public welfare, or praise of government officials, but does not debate or take opposing viewpoints. (Category (3) does not threaten the regime in any way, and indeed Chen, Pan, and Xu (2016) show that local governments openly discuss non-argumentative valence issues with others on government web sites.)

Factual reporting involves descriptions of government programs, events, initiatives, or plans. Cheerleading includes expressions of patriotism, encouragement and motivation, inspirational slogans or quotes, gratefulness, discussions of aspirational figures, cultural references, or celebrations. (Appendix A also includes a sixth “other” or “irrelevant” category, but we remove this so that the percentages from the first five categories add to 100%.)

Thus, social media participants accusing others of being 50c party members agree with journalists and most scholars that the content of 50c posts is basically antidisestablishmentarianism — arguing with those who oppose with the regime, its leaders, or their policies.
We now go a final step and study the identities of accused (as distinct from actual) 50c party members, which can be difficult because such accusations occur on comment or discussion threads where participants are anonymous. However, by careful and extensive cross-referencing of profile information across multiple platforms, we were able to unearth personal details for a handful of these individuals. Their backgrounds vary greatly, but in each case, it seems obvious that they are highly unlikely to be real 50c party members. For example, among those accused of being 50c party members include Zhou Xiaoping (周小平), a blogger well known for his anti-west and nationalist sentiment, and He Jiawei (何家), a blogger known for critiques of the Chinese government who posts on Boxun, a site hosted outside of China devoted to covering topics such as Chinese government human rights abuses. Other well known figures accused of being 50c include Lin Yifu (林毅夫), a Peking University professor who was Chief Economist and Senior Vice President of the World Bank from 2008 to 2012. In none of these cases are these people likely to be actually 50c party members. However, those accused of being 50c party members also include figures not connected to politics such as, in our data, a comedian, a lawyer, and a marketing executive.

It appears that the evidence base of those accusing others of being 50c party members is no better than that of academics or journalists. Although the prior beliefs of all three groups about the content of 50c party posts are almost the same, little evidence supports their claims.

3 Leaked Internet Propaganda Office Communications

1. Data and Methods The problem in the literature has been that “detecting the Wumao [50c party] is difficult because there is no ground truth information about them” (X. Yang, Q. Yang, and Wilson, 2015). We are fortunate to be able to change this situation. In December 2014, anonymous blogger “Xiaolan” (https://xiaolan.me/) released an archive of all 2013 and 2014 emails to, and some from, the account of the Internet Propaganda Office (网宣办), a branch of the propaganda department, of Zhanggong district. Zhanggong district is a country-level administrative unit (with a population in 2013 of
that is part of the moderate sized Ganzhou City, in Jiangxi province. The emails reported activities of Internet commentators, including numerous 50c posts from workers claiming credit for completing their assignments, and many other communications. The hack was widely reported and the archive of emails have been publicly available since Henochowicz (e.g., 2014).

The archive’s large size, complicated structure, numerous attachments, diverse document formats (screen shots, Word, Excel, Powerpoint, raw text, text as part of other emails, etc.), multiple email storage formats, and many links to outside information has made digesting much of it impossible either for individuals reading and coding by hand or for existing methods of automated text analysis. Journalists managed to pull out a few examples to write newspaper articles, but no systematic analysis has been conducted of these data.

To systematize this richly informative (and essentially qualitative) data source, we developed and applied a variety of methods and procedures, from large scale hand coding, to specially tuned and adapted methods of named entity recognition, to methods of automated text analysis and extraction. Because of the considerable effort and resources necessary, we have made structured and easy-to-access forms of these data, along with other replication information, publicly available in dataverse so that others may follow up, including everything Institutional Review Board rules allow us to distribute (see King, Pan, and Roberts, 2017).

From this work, we identified 2,341 emails sent from 2/11/2013 to 11/28/2014. Of these, 1,208 contained the text of one or (usually many) more 50c posts. In all, we harvested from these emails and their attachments 43,757 known 50c posts that form a basis for our subsequent analyses and, as a training set, help identify other 50c posts. (Although we have the name, direct contact information, and often photographs of many of the people discussed in this article, we have no academic reason to make this information more public than it already is and therefore do not do so. Other data and replication information is available in our dataverse archive; see ibid.) We conduct rigorous evaluations of our claims in subsequent sections. For now, we characterize the content with several separate
2. Structure We portray the overall structure of communications in these emails with the network diagram in Figure 1. Each circle is a specific email account and each line denotes where one or more emails was sent from and to. The large flower-like shape at the bottom are 50c party members sending in copies of their posts to the Zhanggong district Internet Propaganda Office (章贡区网宣办), claiming credit for completing their assignments. This office then reports up to other offices (see the lines out from the center of the flower shape), These include the speaker of Zhanggong People’s Court News office (江西省赣州市章贡区人民法院新闻发言人), and District Party Office Information Department (区委办信息科).

Figure 1: Network Structure of Leaked Email Correspondents. Circles are email correspondents, edges (lines) indicate email correspondence. Most of the correspondence is in toward the center of the flower-like structure (to the Zhanggong Internet Propaganda Office and then out from that office to higher level offices.)
3. Identifying 50c Party Members  Next, most of the scholarly literature describes 50c party members as ordinary citizens hired for very low piecemeal wages. We found instead that almost all 50c workers in our sample are government employees (consistent with some arguments by Han 2015b). Of the 43,757 posts, only 281 were made by individuals or groups we could not identify (the content of these posts were very similar to those we could identify). The remaining 99.3% were contributed by one of over 200 government agencies throughout the Chinese regime’s matrix organizational structure (of geographic representation by functional area) in Zhanggong district. This included 9,159 posts (20.9% of the 43,757 total) made directly by the Zhanggong Internet Propaganda Office, 2,343 (5.4%) by the Zhanggong district Bureau of Commerce (区商务局), 1,672 by Shuixi Township (水西镇, one of several townships in Zhanggong), 1,620 by Nanwai sub-district (南外街道, one of several sub-districts in Zhanggong). Others come from functional bureaus in Zhanggong district (e.g., 体育局 Sports Bureau, 人保局 Bureau of Human Resources and Social Security, 地税局 Bureau of Taxation, 法院 Zhanggong district court), the government offices of Zhanggong’s sub-districts and townships (e.g., 沙河镇 Shahe Township, 赣江街道 Ganjiang sub-district), functional departments in each sub-district or township (水西镇党政办 Shuixi Township Party Office), and administrative offices of neighborhoods and villages in Zhanggong’s townships and sub-districts (e.g., 南外街道东阳山社区 Dongyang Shan neighborhood of the Nanwai sub-district, 水西镇何乐村 Hele village of the Shuixi sub-district).

Of the 50c posts in this archive, 29.98% did not contain a URL or a description of the site where the content was posted. Of the remainder, 53.38% of the 50c posts were comments on government sites (GanzhouWeb, Newskj, DajiangWeb, JidanWeb, JiangxiWeb, CCTVWeb, RenminWeb, JiujiangWeb, QiangGouWeb), and 46.62% were on commercial sites. Of the 50c posts on commercial sites, 53.98% were on Sina Weibo, 32.10% on Tencent Weibo, 10.75% on Baidu Tieba, and 2.69% on Tencent QZone, with the rest in the long tail receiving less than 1% each.

We also found no evidence that 50c party members were actually paid fifty cents or any other piecemeal amount. Indeed, no evidence exists that the authors of 50c posts
are even paid extra for this work. We cannot be sure of current practices in the absence of evidence but, given that they already hold government and Chinese Communist Party (CCP) jobs, we would guess this activity is a requirement of their existing job or at least rewarded in performance reviews.

4. Coordination and Content  We now offer a first look at the 43,757 posts from the 50c party we unearthed. We do this by plotting in Figure 2 a daily time series of counts of these posts. The most important finding in this graph is that the posts are far from randomly or uniformly distributed, but instead are highly focused into distinct volume bursts. This suggests a high level of coordination on the part of the government. Indeed, often the most influential patterns in most social media are the bursts that occur naturally when discussions go viral. The government’s manufactured bursts mirror these naturally occurring influential patterns, but at times of the government’s choosing. Bursts are also much more likely to be effective at accomplishing specific goals than a strategy of randomly scattering government posts in the ocean of real social media. (We also looked extensively for evidence that 50c posts were created by automated means such as bots, but the evidence strongly indicates to the contrary, that each was written by a specific, often identifiable, human being under direction from the government.)

Although we conduct rigorous, quantitative analyses of the content of 50c posts in the sections to follow, here we provide a feel for the content of the posts by labeling the largest volume bursts in this set (with numerical labels corresponding to those in the figure). The labels are brief summaries we chose from reading numerous posts, a process we found easy and unambiguous. The list below gives the first indication that the focus of these posts is on cheerleading, possibly for purposes of distraction, rather than engaged argumentation and debate.

1. Qingming (Tomb Sweeping Day): over 18,000 posts about veterans, martyrs, how glorious or heroic they are, and how they sacrificed for China.

2. China Dream: Over 1,800 posts about President Xi Jinping’s “China Dream”. Potentially a reaction to the April 2013 People’s Daily piece instructing municipal
governments to carry out “China Dream” propaganda campaigns (see http://j.mp/chinadream).

3. Shanshan Riots: 1,100 posts, immediately following Shanshan riots in Xinjiang. At 5:30pm, Zhanggong county sent an email to itself (probably BCCing many others), highlighting three popular posts about Xinjiang, and identifying this as a terrorist incident. At 8:00pm on the same day, Zhanggong county sent an email to Ganzhou City to which it reports having created hundreds of 50c posts, seemingly to distract from the riots, about China Dream, local economic development, etc.

4. 18th Party Congress, 3rd Plenum: Over 3,400 posts related to the 3rd plenary session of the Chinese Communist Party’s 18th Congress, which discussed plans for deepening structural reform.

5. “Two Meetings”: Over 1,200 posts about Ganzhou’s People’s Congress and Political Consultative Committee meetings, and policies to be discussed at the two
meetings, including factual reporting of environmental issues, one child policy, rural issues, growth and development.

6. Early May Burst: 3,500 posts, about a variety of topics, e.g., mass line, two meetings, people’s livelihood, good governance. Immediately followed the Urumqi Railway Explosion.

7. Over 2,600 posts celebrating the second anniversary of “Central Soviet Areas Development policy” (若干意见), subsidies from the central government to promote the development of region where the original CCP bases were located (including the region where Zhanggong is located); at the same time, the local government held an online Q&A session for citizens.

8. Martyr’s Day: 3,500 posts about martyrs and the new Martyr’s Day holiday, celebrating heroes of the state.

While we cannot know for certain the exact cause or intended purpose of each burst of 50c party posts, Figure 2 is consistent with a strategy of distraction. For example, several bursts follow events with “collective action potential” (i.e., actual or potential real world crowd formation and related activities; see King, Pan, and Roberts 2013, p.6, for a precise definition). These events include the Shanshan riots and the early May burst following the Urumqi Railway Explosion. Other bursts occur during national holidays when people are not working, which tend to be prime time periods of political unrest. Indeed, the Qingming festival, or holiday of Pure Brightness, has historically been a focal point of protests in China and, for this reason, was largely banned during the Maoist era. In recent years, Qingming, a day on which people pay respects to the dead, has drawn attention to sensitive events, for example, the deaths of those in the 1989 Tiananmen crisis (Johnson, 2016). The central regime and Jiangxi provinces have both issued notices about the Qingming festival as a period when local governments need to increase their vigilance to prevent protest (see http://j.mp/jiangxi and http://j.mp/MinistryCivil). Similarly, political meetings are periods when government and Party official believe protests are more likely to take place. During these
periods, officials gather, and attention is focused on the activities of the regime; as such, successful protests can garner greater attention. Prior to these meetings, measures such as a preemptive redistribution and preemptive repression are put into place to decrease the likelihood of social mobilization (Pan, 2015; Truex, 2016).

5. The Purpose of 50c Posts Although our leaked archive includes specific directions to 50c workers, it does not reveal whether these directions originate from Zhanggong or from higher levels of the government or party. This, and the nearly infinite phenomena that we might identify as potential precipitating events, prevents us from determining the immediate cause of every burst of 50c activity. However, our inference about distraction being the goal of the regime is consistent with directions to 50c party members in emails from the Zhanggong propaganda department. They ask 50c members to “promote unity and stability through positive publicity” (坚持“团结稳定鼓劲、正面宣传为主”) and “actively guide public opinion during emergency events” (积极稳妥做好突发事件舆论引导). In this context, “emergency events” are events with collective action potential.5

We now turn to a more systematic analysis of these posts, their accounts, and others like them beyond Zhanggong.

4 Content of 50c Posts

We now reveal the content of 50c party posts across China by estimating the distribution of these posts over the five main content categories introduced in Section 2 (with details in Appendix A). We do this in five separate analyses and data sets that successively expand the initial set of posts from Zhonggong to larger and larger areas across the country.

5For example, a website developed by the Ministry of Public Security and Ministry of Education to help young people better understand safety issues (http://j.mp/EmergEvents) explains: “Every emergency event involves the self interest of a particular group of people, leading to psychological pressure and change among this group, and understandably leading to concern and worry. Especially for emergency events of a societal nature [as distinct from natural disasters], most are organized by a small group of people, who through their publicity-seeking and encouragement get others involved. Recently, emergency events due to issues like territorial disputes, land requisitions, and housing demolition in certain areas are often organized by one person and involve many, making collective events.” (任何一类突发事件，都必然要涉及一部分人的切身利益，使其产生心理压力和变化，引起人们的关注和不安也属正常。尤其是社会性的突发事件，多是由少数人操纵，通过宣传鼓动把一些群众卷到事件中来。近期，在一些地方因地界、征地、拆迁安置而发生的突发性事件，往往是一人纠合，数人响应，使其具有聚众性。)
Ex ante, we do not know how 50c party activity in Zhanggong might differ from other counties. Originally part of the Jiangxi Soviet, established in 1931 by Mao Zedong, Zhu De, and other leaders, Zhanggong has a rich revolutionary history. These and other factors may make it unusual. On the other hand, directives from the central government, or common interests of different counties in keeping their populations in check, may keep the purpose and content 50c party activity in different counties aligned. As it turns out, for each of the five separate analyses, and in the survey validation in the next section, we find very similar results, with 50c party posts largely comprised of cheerleading and distraction rather than engaged argument. In other words, the patterns found in the leaked data from Zhanggong district do extrapolate.

We conclude this section with a sixth part, reporting on an event that occurred during our observation period that provides strong evidence of coordination across counties and very clear top down control.

1. Leaked 50c Posts  We first analyze the 43,757 50c social media posts we harvested from the leaked archive from Zhanggong. These posts were made by numerous authors on many different social media sites, including national-level platforms run by private sector firms such as Sina Weibo and Baidu Tieba, as well as government forums at the national, provincial, prefectural, and county levels. To study these data, we begin by hand coding a random sample of 200 posts into our categories (again with high inter-coder reliability).

One result is immediately apparent: The number of posts from this sample that fall in the categories “taunting of foreign countries” or “argumentative praise or criticism” is exactly zero. This is an important surprise, as it is essentially the opposite of the nearly unanimous views espoused by scholars, journalists, activists, and social media participants. This result would be highly unlikely to have resulted from (Binomial) sampling error if the true share of the full set were even as large as a few percentage points (at 5%, which would still be a major surprise, the probability of seeing the sample we obtained is essentially zero). To push even farther, we did extensive searches and reading among the remaining posts and finally found a few that fit this category (see the examples in Categories 2 and 3 in Appendix A), but the overall result is that 50c party posts are extremely
rare in these categories.

We thus infer that the leaked posts contain very little Taunting of Foreign Countries or Argumentative Praise or Criticism; we verify this by formally estimating all the category proportions in the entire set of posts. Using a text analytic method known colloquially as “ReadMe” (named for the open source software that implements it), we estimate the category proportions directly, without having to classify each post into a category (Hopkins and King, 2010). This is fortunate, since individual classifiers that manage to achieve high (but imperfect) levels of the percent correctly classified, may still generate biased estimates of the category proportions. For example, an estimate indicating that zero country dyad-years, since WWII, were at war achieves a predictive accuracy of about 99.9%, but aggregating these classifications yields an obviously biased (and useless) estimate of the prevalence of war. In contrast, ReadMe does not give individual classifications, but it has been proven to give approximately unbiased and consistent estimates of the category proportions, which here is the relevant quantity of interest. The other advantage of ReadMe in this context is that its statistical assumptions are met by our sampling procedures.

The estimated proportions of 50c posts by category for all data sets appear in Figure 3; the results for our first data set (of all posts found in the leaked emails in Zhanggong) are represented by a histogram, formed by the set of solid disks (●) for the point estimate, and solid line for the confidence interval, for each of the categories. Other results, to be described below in order from left to right within each category, also appear in the same graph.

The categories in Figure 3 are arranged so that the two emphasized in the literature appear on the left, and our main empirical results on the right. For this analysis, the results indicate that approximately 80% fall within the Cheerleading category, 14% in Non-argumentative praise or suggestions, and only tiny amounts in the other categories, including nearly zero in Argumentative praise or criticism and Taunting of foreign countries. Clearly, these results clearly indicate that 50c posts are about cheerleading, not argumentation.
2. Posts from Leaked 50c Weibo Accounts  One possibility we now consider is whether 50c party members differentially reported cheerleading posts back to the Propaganda Department, even though they posted about topics at the behest of the regime from other categories as well. To study this question, we construct a second data set by first identifying all Weibo social media accounts revealed in the leaked email archive. We choose Weibo because it is the most widely used social media site that enables mass distribution, and we were able to obtain access in the manner we needed it. We then found these accounts on the web and kept all 498 Weibo accounts that made at least one post. Finally, we downloaded all social media posts from these accounts, yielding a set of 167,977 known — but not previously leaked — posts from 50c accounts.

We drew a random sample (stratified by account) of 500 of these 167,977 social media posts, and coded them into our categories as a training set. In this randomly selected training set, like the last, we find no evidence of taunting of foreign countries, although we did find a handful of posts in the category of Argumentative Praise or Criticism, consti-
tuting only 3% of the posts. As above, we then used (a stratified sample and) ReadMe to estimate the five category proportions for the set of all posts. The results, reported in the second bar of the histogram in Figure 3, are very similar to that from the first data set. The point estimates (portrayed as solid triangles, ▲, with confidence intervals as dashed lines) indicate that again the bulk of 50c posts from leaked accounts are Cheerleading (51%), 20% in Factual Reporting, 23% in the category Non-argumentative praise or suggestions, and only 6% in the category Argumentative praise or criticism.

3. Partitioning Leaked Accounts for Extrapolation  We designed our third analysis to further explore the leaked data as well as to prepare the ground for extrapolation. The key idea here is to partition the Sina Weibo accounts (from Analysis 2) into those easy to identify outside the leaked archive (which we do for Zhanggong in Analysis 4 and in other counties in Analysis 5) and those more difficult to identify. We develop an algorithm to distinguish these two account types and then show that we only need to extrapolate the first type because they post the same types of content.

To find a useful partition, we begin by studying the structure of the 498 known 50c Weibo accounts and their 167,977 social media posts. In each type, we often find many commercial posts, which fall in our “other” category (see the Appendix). Since we remove and condition on this “other” category for all analyses, we do not define account types on this basis either. The first type of account, which we call ordinary, are used by apparently ordinary people in China to post about their children, funny videos, commercial advertisements, sports teams, pop stars, personal opinions, and many other subjects. Embedded within the stream of these posts are those which these authors indicate in their communication with the Propaganda Department to be 50c party posts. The second, which we call exclusive accounts, are (aside from commercial posts) almost exclusively devoted to 50c posts. Near as we can tell, via extensive cross-checking with external data sources, ordinary accounts are genuine, registered in the name of person (usually government employee) posting on it, whereas exclusive accounts are pseudonymous, designed solely to fool those who see it. In both cases, the 50c posts on these accounts are those directed by the government rather than necessarily reflecting the opinions of ordinary people.
Distinguishing between ordinary and exclusive accounts in our leaked archive is easy (the number of real 50c posts reported to the Propaganda Department, as a proportion of all posts on the account, is a direct measure), but our goal is to extrapolate to other counties where we have no known 50c posts. Thus, we need a formal partitioning algorithm to sort accounts into these two categories without needing the inside information we have from our extraordinary leaked data. Moreover, since our goal is to determine the content of 50c posts, we must be able to discern whether an account was written by a 50c party member without using the text of the posts.

To develop this partitioning algorithm, we followed the logic of “Bayesian falling rule list” methodology, which are accurate and also highly interpretable (Letham et al., 2015). The interpretability also enabled us to combine qualitative knowledge with modern machine learning, as well as to make choices that were much easier to apply outside of Zhanggong. With this approach as a guide, we found that two simple rules are sufficient to partition our 498 50c accounts into exclusive and ordinary: First, we obtain candidate 50c accounts by collecting all accounts that comment on or forward any post on the Zhanggong government weibo account (http://weibo.com/u/3880516376). Second, we narrow this to accounts with 10 or fewer followers. The result is a set of what we call exclusive accounts. These two simple, interpretable rules are highly plausible and consistent with what is known about social media. After all, accounts that engage with government websites and have no more than a handful of followers are likely used for a very specific purpose. (Because of how Weibo differs from platforms like Twitter, users of Weibo accounts with few followers can still be highly influential by commenting on other, more popular accounts.)

We now show that the 50c posts appearing on exclusive and ordinary accounts have essentially the same types of content, where we can verify both. To do this, we apply our partitioning algorithm to the set of 498 known 50c accounts from our archive and then compare the content of ordinary and exclusive accounts. We find that 202 (41%) are exclusive accounts and the remaining 296 (59%) are ordinary accounts. This partition of the data is neither right nor wrong (and so statistics like “percent correctly classified” do
not apply), but it is useful only to the extent that using only the exclusive posts causes no bias. Thus, we estimate and compare the distribution of posts within the ordinary and exclusive account types across our five content categories. To do this, we apply ReadMe within each partition and compare the results.

Fortunately, the results are very close to each other, and (as a result) to the overall results we presented above. This implies that bias is unlikely to be induced by narrowing our search outside our leaked archive to exclusive accounts. Point estimates for the category proportions appear in Figure 3 (marked as □ and ×, in red). For both, the bulk of 50c posts appear in the Cheerleading category (46% for exclusive accounts and 58% for ordinary accounts). In contrast, the sum of taunting of foreign countries and of argumentative praise or criticism is very small (5% for exclusive and 11% for ordinary).

4. Unleaked 50c Posts in Zhanggong We now use the results about ordinary and exclusive accounts Analysis 3 and expand our extrapolation beyond the 50c posts in the leaked archive (from Analysis 1) and new unleashed Sina Weibo posts we found from the accounts identified in the leaked archive (Analysis 2). The key for this extrapolation is that all three of these analyses yielded very similar estimates of the distribution of 50c posts across our five categories of interest. We thus now narrow our extrapolation to Weibo posts from exclusive accounts, which are easier to find, even though we strongly expect 50c posts to be made in many different platforms, including those run by private firms, different levels of government.

In this section, we focus on previously unidentified 50c posts in Zhanggong. To do this, we choose exclusive accounts (by applying the two rules from the previous section). With this procedure, we find 1,031 accounts, of which 829 accounts are not mentioned in our leaked archive. We then find and scrape all 22,702 social media posts available from the front page of each of these accounts. Each front page has up to 45 separate posts. We then analyze these posts with ReadMe, as above.

Results from this analysis appear in Figure 3 (with point estimates represented by ×). The result again is very similar to previous analyses: 57% of the posts made on these accounts engaged in Cheerleading, 16% engaged in Factual Reporting, 22% engaged in
Non-argumentative praise and suggestions, and about 4% in Taunting of foreign countries and essentially zero in Argumentative praise or criticism.

5. Unleaked 50c Posts in Counties with County Government Weibo Accounts  We now extrapolate to counties across China. We do this by starting with all 2,862 counties (and county-level divisions). We then take as our target of inference 50c behavior in 1,338 of these counties which are structured same way as Zhanggong, with a Propaganda Department that has a public web site. We then drew a simple random sample of 100 of these counties and identified all exclusive accounts and a sample of their social media posts.6

To be more specific, for each county government Weibo account, we collected all 151,110 posts, randomly sampled up to 200 posts of these, identify all outside Weibo accounts that commented on or forwarded any one, downloaded all meta-data from those accounts, and subsetted to those with 10 or fewer followers. We then download the first page, comprising up to 45 social media posts from each account, as our candidate 50c posts.

Figure 3 provides our results (with point estimates represented as a diamond, ⬤). Again, we find very similar results, highly focused on cheerleading and distraction rather than argumentation and criticism: 64% of the posts made on these accounts are categorized as Cheerleading, 18% in Factual Reporting, 9% Non-argumentative praise and suggestions, 4% in Taunting of foreign countries, and only 4% in Argumentative praise or criticism.

6. Coordination and Top Down Direction  The analyses thus far suggest a high level of coordination in the timing (Figure 2) and content (Figure 3) of 50c party activity. Here, we offer evidence that these efforts may be directed from the highest levels of the regime.

In late February 2014, Chinese President Xi Jinping led the first meeting of the Central Leading Group for Internet Security and Informatization. The meeting was also attended

---

6Many of the remaining 1,524 counties have Weibo accounts run by government bureaus and agencies (such as public security department, civil affairs department), but not by the county-government. Our informal study of these counties revealed no systematic differences from those we studied, but following up with systematic study in these counties would be a good topic for future research.
by two other top leaders, Li Keqiang, China’s premier, and Liu Yunshan, head of the
Chinese Communist Party (CCP) propaganda department. During this meeting, President
Xi stressed the need to for government officials to “have a good grasp of the timing,
degree, and efficacy of online public opinion guidance so that online spaces are clear
and unclouded” (把握好网上舆论引导的时、度、效，使网络空间清朗起来) (Xi, 2014). Xi’s phrase public opinion guidance is the official term for CCP policies
and practices designed to control or influence public opinion. (This includes “traditional”
guidance, such as CCP control of the press, as well as newer types of opinion guidance
for social media such as 50c party activity, censorship, the Great Firewall, etc.) President
Xi repeatedly stressed in the meeting the need for the regime to build infrastructure and
a solid foundation for ensuring “internet security” (which refers to cybersecurity more
broadly in addition to public opinion guidance).

As this event occurred near the middle of our data, we can look for evidence that it had
an effect. Thus, we calculate that over the two years we observed in Zhanggong, 50c party
members created an average of 7.7 social media accounts per month. Yet, 156 accounts
were created the month of the meeting and 39 the month after. Similarly, in our predicted
data, an average of 19.0 accounts were created per month. Yet, they created 41 accounts
were in the month following and 174 in the month after. We interpret these strong patterns
as evidence that governments all across China responded directly Xi’s call.

5 Verification by Direct Survey

We now attempt to go an extra step to verify the accuracy of our extrapolation in Section 4
to predicted 50c party members across China. To do this, we take the unusual step, in this
context, of conducting a sample survey of predicted 50c party members, along with gold
standard elements designed even to validate this method of validation. 7

7We had full IRB approval for our study (although we cannot make public our exact question wording in
Chinese, sample size, certain statistics, or the original data). We also added our own additional ethics rules
not required by the IRB designed to further protect the identities of our respondents and to keep our large
research team safe. Our rules followed the principle articulated in King, Pan, and Roberts (2014, fn.20) of
trying to avoid influencing the system we were studying, which has the added advantage of reducing the
chance for bias.
1. Design  We began by creating a large number of pseudonymous social media accounts. This required many research assistants and volunteers, having a presence on the ground in China at many locations across the country, among many other logistically challenging complications. We conducted the survey via “direct messaging” on Sina Weibo, which enables private communication from one account to another. With IRB permission, we do not identify ourselves as researchers and instead pose, like our respondents, as ordinary citizens. Since information in our archive appears to indicate that government monitoring of 50c party member activities occurs only through voluntary self-reporting up the chain of command, our survey questions and the responses are effectively anonymous, which are conditions that have been shown to make respondents more sincere in responding to sensitive questions (Tourangeau, Conrad, and Couper, 2013).

We drew a random sample of social media accounts we predicted in Section 4 to be 50c and asked each whether he or she was indeed a 50c party member (in a special manner described below). Of course, the difficulties of interpreting these answers is complicated by the fact that our survey respondents are conducting surreptitious operations on behalf of the Chinese government designed to fool participants in social media into thinking that they are ordinary citizens, and we are asking them about this very activity. In most cases, the government is also their employer, and so they have ample incentives to not comply with our requests, or to not comply sincerely.

We address these uncertainties with two entire additional surveys designed to provide internal checks on our results, as well as a carefully worded survey question in our anonymous survey context. In most surveys, researchers are left trusting the answer, perhaps after a stage of pretesting or cognitive debriefing. In our survey, we are in the unusual position of being able to go further by offering a gold standard validation, where, for some respondents, we know the outcome to the question we are posing. That is, we ask the same question of a random sample of known 50c party members from our Zhanggong leaked archive. If the results of our survey of predicted 50c party members give similar results as this survey, then we should have more confidence in the results.

We also offer a third entire survey that approximates the opposite gold standard by
asking those known not to be 50c party members. To do this, we draw a random sample from Weibo accounts across China among those who do not engage with government Weibo accounts and have more than 10 followers. Our results would be confirmed if the percent who say they are 50c in this sample are significantly lower than those who acknowledge being 50c in our predicted 50c sample. A tiny fraction of these accounts may actually be 50c, but that would merely bias the results against the test of our hypothesis of the difference in means from our set of predicted 50c members.

The final way we reduce uncertainty is in the design of our survey question. We followed best practices in designing survey questions about sensitive topics, including adjusting the perceived social environment (Näher and Krumpal, 2012) and using familiar language and positive “loading” of sensitive questions (Groves et al., 2011). We also studied a large volume of social media interactions, both via automated means (King, P. Lam, and Roberts, 2016) and by direct reading, and found a way within the cultural context to ask the question so that it would be more likely to elicit a sincere answer. We also pre-tested our survey on an independent sample. Although preserving the confidentiality of our respondents and research team makes us unable to share the exact text of our question, we report here a similar version in English, which will also enable us to explain its features:

I saw your comment, it’s really inspiring, I want to ask, do you have any public opinion guidance management, or online commenting experience?

To avoid interfering or influencing the system we are studying, and to avoid putting our respondent in an uncomfortable position, the question discusses online propaganda in positive terms. We use the term “opinion guidance management” and “online commenting,” which is the terminology the government uses to discuss these tasks. We avoid terms like 50c which has negative connotations for some. Instead of asking someone to “out” themselves as a 50c party member, we ask for advice on where the person learned to write in such a motivating, inspiring manner, thus avoiding generating defensiveness on part of the respondent.
2. Results  High quality web surveys have response rates of about 3.5% (Pew Research Center, 2014). The response rate for our survey was almost twice that at 6.5% which, although small on an absolute level, is encouraging given our more challenging environment. In addition, unlike most web surveys, we were able to perform some checks for selection bias because we collected available information on our entire target sample, before administering our survey question. This information to test for selection bias included variables such as the number of followers, gender, year of creation, average number of posts for each month, and enabling geo-location; we also observed each of these variables within the five separate data sources in Section 4. The vast majority of tests we conducted indicated statistically insignificant differences between respondents and non-respondents. The few differences that appeared are negligible compared to the large effect sizes we present below. As might be expected, the data contains some evidence that 50c party members are less likely to respond to our question than non-50c party members, which has the effect of making it more difficult to confirm our hypothesis. Although we could weight the results below by the differences we found, they are small enough that we chose to present the raw, unprocessed data below instead.

The results for our three surveys appear in Table 1. Overall, we found that 59% of our predicted 50c party members admitted to being 50c party members. If we are correct that they are all 50c party members, then the remaining 41% gave an insincere answer, which would not be surprising given that doing so is essentially their job. To test this, we use our gold standard sample of known 50c party members revealed in our leaked Zhanggong email archive. In this sample, 57% admitted to their 50c party status. The two percentage point difference between these two figures is not statistically significant (at \( \alpha = 0.05 \)), suggesting that indeed all respondents in our predicted sample are 50c.

Also as a test, we use our gold standard sample that approximates those known to not be 50c party members. In this sample, only 19% said they were 50c; the substantial 40 percentage point difference between this figure and that from our predicted 50c party member sample (59%) is very large and statistically significant, revealing a strong signal of actual 50c party membership among our predicted 50c sample. (Near as we can tell,
if we had asked much more directly whether our respondents were 50c party members, those who were not would have responded with angry denials. This would have had the advantage of dropping the 19% figure nearer 0%, but it would likely also have threatened our entire project. The survey would also have failed, because then few or no actual 50c party members would have answered our survey question.) Overall, the results from this survey strongly support the validity of the predictions of 50c party membership conducted in Section 4.

The difference between the first and second lines is not statistically significant; the difference between the first and the third is statistically significant (both at $\alpha = 0.05$).

6 Size of the 50c Party

In this section, we study how widespread 50c activity is. Overall, we find a massive government effort, where every year the 50c party writes approximately 448 million social media posts nationwide. About 52.7% of these posts appear on government sites. The remaining 212 million posts are inserted into the stream of approximately 80 billion total posts on commercial social media sites, all in real time. If these estimates are correct, a large proportion of government web site comments, and about one of every 178 social media posts on commercial sites, are fabricated by the government. The posts are not randomly distributed but, as we show in Figure 2, are highly focused and directed, all with specific intent and content. The rest of this section explains how we estimate these numbers. Throughout, in lieu of the possibility of formal standard error calculations, we offer transparent assumptions that others can easily adjust to check sensitivity or improve as more information is unearthed.
1. Number of Social Media Posts  To understand the context into which 50c posts are inserted, we begin by estimating the total number of Chinese social media posts nationwide. As of December 2012, netizens were posting approximately 100 million messages a day, or 36.5 billion a year, on Sina Weibo alone (Zhao et al., 2014), which is one of at least 1,382 known social media sites (King, Pan, and Roberts, 2013). In our data, the ratio of Sina Weibo posts to all posts is 1.85, meaning that an estimate of the total number of posts on all platforms is $(1.85 \times 36.5 \text{ billion}) = 67.5 \text{ billion}$. However, this requires the strong assumption that 50c party members use specific commercial social media platforms in the same proportions as the entire user population. We therefore use the detailed survey from iiMedia Research Group (2014) and calculate that the ratio of total posts to Sina Weibo posts to be 2.10, and the total number of posts per year to be about 80.4 billion. This is an underestimate because it is based on microblogs and ignores blogs, but blogs probably number in the millions which is rounding error on this scale.

2. Number of 50c Posts in Zhanggong  Among the 43,757 confirmed 50c posts, 30,215 were made during a 365 day period between 2/11/2013 (the first day on which we observed a 50c post) and 2/10/2014. We have evidence of at least 1,031 exclusive (Sina Weibo) accounts in Zhanggong, including 202 accounts in the leaked archive and 829 we identified outside the archive (by following the rules in Section 4).

In our archive, a 50c party member needing to make a post chooses an exclusive account on Weibo ($\frac{689}{43,757} = 1.57\%$) of the time compared to all other choices (an ordinary account on Weibo or another social media site). We assume this ratio is approximately the same for non-leaked 50c posts in Zhanggong, which in turn implies that the ratio of total 50c posts to 50c posts in the archive is the same as the ratio of total exclusive accounts to exclusive accounts in the archive. As such, an estimate of the total number of posts in Zhanggong in 2013 is $(30,215 \times 1,031/202 =) 154,216$.

3. Number of 50c Posts in Jiangxi Province  Zhanggong is an urban district of Ganzhou City within Jiangxi province. According to China Internet Network Information Center’s Statistical Report on Internet Development in China 2014, the 2013 Internet penetration of
urban residents was 62.0% and of rural residents was 27.5% (http://j.mp/CNNIC).

According to the National Bureau of Statistics of China, 48.87% of the 45.22 million people in Jiangxi province lived in urban areas, or 22.10 million, with 23.12 million living in rural areas (http://j.mp/ChinaSY).

We first compute the number of 50c posts per internet user in Zhanggong, which is $(154,216/468,461 \times 0.62) = 0.531$. We then assume that this rate is roughly the same in Jiangxi and then scale up. Thus, we estimate the total number of 50c posts in Jiangxi during 2013 as $(0.531 \times [0.62 \times 22.1M + 0.275 \times 23.1M]) = 10.65$ million.

4. **Number of 50c Posts in China** Finally, to scale this result to all of China, we assume that the ratio of 50c posts to internet users in other parts of China is roughly the same as in Jiangxi. This ratio of posts per Internet user is $(10.65M/14.68M =) 0.7255$. Applying this assumption to the country as a whole reveals the presence of $(0.7255 \times 617.58M =) 448.0$ million 50c posts in China during 2013 (see http://j.mp/CNNIC).

7 **What Might Be Wrong?**

Inferences in this article depend on the veracity of the leaked archive we analyze. The size and extraordinary complexity of this archive makes it highly likely to be real. There are no signs of it having been generated by automated means, and fabricating it by hand to mislead would have been a monumental task. We have also verified numerous external references from the data — to specific individuals, email addresses, phone numbers, government departments, programs, web sites, social media accounts, specific posts, etc. — and every one checks out. Nevertheless, we have no information about the leak actually occurred.

Chinese government astroturfing efforts may exist that do not follow the model we unearthed in Zhanggong. (For example, based on anecdotal evidence we have come across, it is possible that the public security bureaucracy and Communist Youth League may also be involved in fabricating social media content.) It is possible that other organizations may hypothetically follow different rules and practices, perhaps varying in different places, and
may generate 50c posts with different types of content. Determining whether it is must
wait for new evidence to be unearthed. Perhaps the window this article opens on this large
and previously secretive government program may help others discover different aspects
of it in China, and eventually in other related authoritarian regimes.

We have observed that the content of 50c party posts across China is largely about
cheerleading, and to a lesser extent non-argumentative praise or suggestions and factual
reporting. Since humans have highly limited attention spans, and vast increases in the
volume of information competing for their attention in the digital age, huge bursts of
irrelevant posts about cheerleading will certainly be distracting to at least some degree.
We are not able to quantify how distracting these posts are in practice or, as a result, how
effective the overall 50c strategy is. Our results do suggest some interesting experiments
that could be run by future researchers.

We have also gone another step and inferred that the purpose of 50c activity is to
(a) to stop arguments (for which distraction is a more effective than counter-arguments)
and (b) to divert public attention from actual or potential collective action on the ground.
As inferences, these are, by definition, more uncertain than observations, and so we now
briefly consider five alternative possible interpretations of our evidence.

First, perhaps 50c activity is a simple extension of the traditional functions of the
propaganda system, and not always focused on collective action. This point is definitely
possible, that propaganda workers engage in cheerleading because they are not motivated
to excel and because they are guided by what Han (2015b) describes as a “persistent state
propaganda logic” that contravene covert activity. On the other hand, however, the cheer-
leading we identify departs from the traditional focus of the CCP propaganda department
on guiding the content of media and shaping public opinion (Brady, 2009; Lynch, 1999).
In addition, we have offered clear evidence that most 50c posts from our data appear in
highly coordinated bursts around events with collective action potential — either after
unexpected events or before periods of time such as Qingming festival and political meet-
ings when collective action is perceived by the regime to be more likely. Of course, it
may also be that these bursts of 50c posts have different purposes depending on the need
as perceived by the regime.

Second, it may be that cheerleading about (essentially) irrelevant topics merely creates a general sense of positiveness which transfers over to positiveness about other things including the regime. This may well be true, but such an effect is not likely to be large. This hypothesis would, however, be testable by experiment, perhaps even in a lab setting.

Third, might the purpose of 50c posts be to dilute negative opinion through generally positive cheerleading? In fact, this is unlikely, since 50c posts are about irrelevant issues and so do not change the balance of positive vs negative comments. It is true that 50c posts do change the percentage of negative comments as a proportion of all posts, but more research is needed to determine how 50c posts interact with characteristically bursty and highly variable social media posts about every possible issue unrelated to politics and whether the influx of 50c comments to change the percent of negative comments as a proportion of all posts has any tangible effect on public beliefs and perceptions.

Fourth, perhaps the point of 50c activity is to signal to the people that they are under surveillance. Although when sent through censorship, a signal like this may be effective in getting people to self-censor their posts and other activities, which posts are 50c is not known to the Chinese people and so this is unlikely to be correct.

Finally, we might ask whether some of the few posts appearing in the empirically small categories of non-argumentative praise or factual reporting might actually be sarcastic, backhand ways of making arguments. This is possible, but our methods are human led and computer-assisted, and so such sophisticated and subtle arguments would have to confuse our human coders and yet still not mislead Chinese social media participants. In fact, even in the unlikely situation where 100% of these posts were misclassified from argumentative praise or suggestions, the vast majority would still be cheerleading and our conclusions would remain largely unchanged.

8 Theoretical Implications

The empirical results offered above seem clear, but what do they suggest about the overall strategy of the Chinese government, or for authoritarian regimes in general? We first ex-
plain these results by generalizing prior findings on (human) censorship and (automated) filtering, all led by the same propaganda department in the same government as the 50c party (King, Pan, and Roberts, 2013, 2014). We then extend these ideas to the authoritarian literature in general.

1. China One way to parsimoniously summarize existing empirical results about information control in China is with a theory of the strategy of the regime. This theory, which as with all theories is a simplification of the complex realities on the ground, involves two complementary principles the Chinese regime appears to follow, one passive and one active. The passive principle is do not engage on controversial issues: do not insert 50c posts supporting, and do not censor posts criticizing, the regime, its leaders, or their policies. The second, active, principle is stop discussions with collective action potential, by active distraction and active censorship. Cheerleading in directed 50c bursts is one way the government distracts the public, although this activity can be also be used to distract from general negativity, government related meetings and events with protest potential, etc. (Citizens criticize the regime without collective action on the ground in many ways, including even via unsubstantiated threats of protest and viral bursts of online-only activity — which, by this definition, do not have collective action potential and so are ignored by the government.)

These twin strategies appear to derive from the fact that the main threat perceived by the Chinese regime in the modern era is not military attacks from foreign enemies but rather uprisings from their own people. Staying in power involves managing their government and party agents in China’s 32 provincial-level regions, 334 prefecture-level divisions, 2,862 county-level divisions, 41,034 township-level administrations, and 704,382 village-level subdivisions, and somehow keeping in check collective action organized by those outside of government. The balance of supportive and critical commentary on social media about specific issues, in specific jurisdictions, is useful to the government in judging the performance of (as well as keeping or replacing) local leaders and ameliorating other information problems faced by central authorities (Dimitrov, 2014a,b,c; Wintrobe, 1998). As such, avoiding any artificial change in that balance — such as from 50c posts
Distraction is a clever and useful strategy in information control in that an argument in almost any human discussion is rarely an effective way to put an end to an opposing argument. Letting an argument die, or changing the subject, usually works much better than picking an argument and getting someone’s back up (as new parents recognize fast). It may even be the case that the function of reasoning in human beings is fundamentally about winning arguments rather than resolving them by seeking truth (Mercier and Sperber, 2011). Distraction even has the advantage of reducing anger compared to ruminating on the same issue Denson, Moulds, and Grisham (2012). Finally, since censorship alone seems to anger people Roberts (2015), the 50c astroturfing program has the additional advantage of enabling the government to actively control opinion without having to censor as much as they might otherwise.

2. Authoritarian Politics  For the literature on authoritarian politics in general, our results may help refine current theories of the role of information, and in particular what is known as “common knowledge,” in theories of revolutionary mobilization. Many theories in comparative politics assume that autocrats slow the spread of information critical of the regime in order to minimize the development of common knowledge of grievances which, in turn, may reduce the probability of mobilization against the regime. The idea is that coordination is essential to revolution, and coordination requires some common knowledge of shared grievances (Chwe, 2013; Egorov, Guriev, and Sonin, 2009; Hollyer, Rosendorff, and Vreeland, 2014; Persson and Tabellini, 2006; Tilly, 1978).

In contrast, our results suggest that the Chinese regime differentiates between two types of common knowledge — about specific grievances, which they allow, and about collective action potential, which they do a great deal to avoid. Avoiding the spread of common knowledge about collective action events (and not grievances) is consistent with research by Kuran (1989, 1991), Lohmann (1994), and Lorentzen (2013), who focus specifically on the spread of information about real-world protest and on-going collective action rather than the generic spread of common knowledge more broadly.

The idea is that numerous grievances of a population ruled autocratically by non-
elected leaders are obvious and omnipresent. Learning of one more grievance, in and of itself, should have little impact on the power of a potential revolutionary to ignite protest. The issue, then, appears not to be whether such grievances are learned by large enough numbers to foment a revolution. Instead, we can think of creative political actors, including those aspiring to lead a revolution or coup, as treating issues, ideologies, events, arguments, ideas, and grievances as “hooks on which politicians hang their objectives and by which they further their interests,” including interests that entail initiating or fostering a political uprising (Shepsle, 1985). If one hook is not available, they can use another.

By this logic, then, common knowledge of grievances is already commonplace and so allowing more information about them to become public is of little risk to the regime or value to its opponents. Since disrupting discussion of grievances only limits information that is otherwise useful to the regime, the leaders have little reason to censor it, argue with it, or flood the net with opposing viewpoints. What is risky for the regime, and therefore vigorously opposed through large scale censorship and huge numbers of fabricated social media posts, is posts with collective action potential.

9 Concluding Remarks

Academics and policymakers have long been focused on contested physical spaces, over which military wars have been or might be fought. For example, in the South China Sea, the Chinese regime is presently building artificial islands and the US is conducting military exercises, both highly expensive shows of power. As important as this focus may be, we think scholars and policymakers should focus considerably more effort on the Chinese internet and its information environment, which is a contested virtual space, one that may well be more important than many contested physical spaces. The relationship between the government and the people is defined in this space and so the world has a great interest in what goes on there. We think considerably more resources and research should be devoted to this area. Whatever the appropriate relationship between governments and their people, a reasonable position is that it be open and known. This is an area were academic researchers can help. By devoting great effort, they can open up this knowledge
to the world. We hope others follow up the research we report on here.

More specifically, the vast majority of journalists, activists, participants in social media, as well as some scholars have, until now, argued that the massive 50c party is devoted to engaging in argument that defends the regime, its leaders, and their policies. Our evidence indicates the opposite — that the 50c party engages in almost no argument of any kind and is instead devoted primarily to cheerleading for the state, symbols of the regime, or the revolutionary history of the Communist Party. We interpret these activities as the regime’s effort at strategic distraction from collective action, grievances, or general negativity, etc.

It also appears that the 50c party is mostly composed of government employees contributing part time outside their regular jobs, not, as has been claimed, ordinary citizens paid piecemeal for their work. This, nevertheless, is still an enormous workforce that, we estimate, produces 448 million 50c posts per year. Their effectiveness appears maximized by the effort we found of them concentrating the posts into spikes at appropriate times, and by directing about half of the posts to comments on government web sites.

Appendix A   Categorization Scheme

Our categorization scheme for social media posts includes the six categories below, along with examples of each. Non-Chinese speakers should be aware when reading these examples that the Chinese language, even on social media, tends to be quite flowery and formal, with frequent creative, and often (to English speakers) stagy-sounding, wordings.

(1) Taunting of Foreign Countries   Favorable comparisons of China to other countries; insults to other countries; taunting of pro-democracy, pro-West, pro-individual liberties, or pro-capitalist opinions within China. Examples from leaked Zhanggong 50c posts:

- 去年，奥巴马在香格里拉会议上力邀23国参与围堵中国时这样说道：“中国有13亿人，他们越崛起，我们就会越没饭吃，因为地球资源供给是有上限的。所以为了我们能继续过现在的生活，就必须遏制中国的发展。” [Last year, at the Shangri-la Dialogue where Obama invited 23 countries to participate in the containment of China, he said: “China has 1.3 billion people, the faster China rises, the more difficult it will be for us to live, because the earth’s resources are limited. For us to remain at our current living standard, we must contain China’s development.”]

- 中国的崛起大势已经不可阻挡。美国一边公开宣称不是中国死就是西方亡，一边又拼命告诉中国民众：你们的政府有问题啊，必须推翻它，然后你们
China’s rise is now inevitable. On one hand, the US publicly asserts that if China does not perish the West will wither; on the other hand it tells the Chinese people that your government is problematic: you have to overthrow it so you can live a better life. Is there a more ridiculous and contradictory logic than this?

(2) Argumentative praise or criticism Comments on controversial, Pro/Con (non-valence) issues, as well as claims of wrongdoing or unfairness; praise (usually of the government) or criticism (usually of opponents of the government); taking a position or explaining why a particular viewpoint is correct or (more often) wrong. These posts are often part of a debate, in opposition to a previous post. Examples from leaked Zhanggong 50c posts:

- 我亲爱的朋友們，翻一下你的微博，你会发现系统已经自动帮你添加了诸如薛蛮子、李开复、李承鹏等各种民粹微博，这是标准的强制灌输和洗脑手段，建议你取消关注 [My dear friends, you if you go through your Weibo, you’ll discover that the system automatically had you follow Xue Manzi, Li Kaifu, Zuo Yeben, Han Han, Li Chengpeng and other populist Weibo users. This is a typical tactic of indoctrination and brainwashing, I suggest you unfollow them.]
- 李开复说纽约60万美金一套别墅，比北京便宜多了，但他不会告诉你那套所谓的别墅其实是个仓库，而且离纽约市区开车需要四个多小时 [Li Kaifu says that you can buy a villa for $600,000 USD in New York, much cheaper than in Beijing. But what he doesn’t tell you is that this so-called villa is actually a warehouse, which is more than a four hour drive from New York City.]

(3) Non-argumentative Praise or Suggestions Noncontroversial valence issues which are hard to argue against, such as improving housing and public welfare; praise of current government officials, programs, or policies. It doesn’t respond to alternative, opposing viewpoints, and it includes positive sentiment. It is distinguished from category (2) in that it praises something specific such as the government, its officials, government programs, or initiatives, but does not take issue with another post. Includes a small number of constructive suggestions for what government policies might include (i.e., added benefits rather than critical complaints). It does not argue against a specific viewpoint, but just says “it would be nice if the government did X,” which usually the government is already in the process of implementing. Some examples of known Zhanggong 50c posts:

- 政府...做了好多实事，其中解决了好大一部分的人住房。 [The government has done a lot of practical things, among which is solving a significant part of the housing problem]
- 土坯房改造政策，让我们村的人搬出了坯房都住上了小洋楼，村里发生了翻天覆地的变化，真是太感谢了。 [The policy of renovating mud-brick houses has allowed villagers to move out of mud-brick dwellings into small, Western-style buildings. The village has been transformed, we are so grateful]
- 希望中央支持力度更大 [We hope the central government provides us with even more support]
• 希望能有更多类似《若干意见》的好政策！[We hope there will be more good policies like "Various Opinions" (the abbreviated name of an economic development policy)]

• 期待书记带领我们…特别是在教育、医疗卫生方面，争取更多政策为百姓谋取更大福祉。[We look forward to the leadership of our party secretary… We hope that he can carry out more policies that will benefit the people in different aspects, especially in education and health care.]

(4) Factual Reporting  Descriptions of current government programs, projects, events, or initiatives, or planned or in progress initiatives. Does not include any praise of these programs or events (which would be category (3)), just that they are occurring. Reporting on what government, government officials are doing. Some examples of known Zhanggong 50c posts:

• 清明三天假期7座小客车继续免费 [During the Qingming festival three-day holiday, [the freeway] will remain free to 7-seater buses]

• 6月27日，江西省委作出向龚全珍同志学习的决定，号召全省党员干部深入学习龚全珍坚定信念、永葆本色的坚强党性，服务群众、一心为民的质朴情怀，忠于职守、矢志不渝的执着追求，淡泊名利、无私奉献的高尚情操，勤俭节约、艰苦朴素的生活作风。[On June 27, the Jiangxi provincial committee promulgated an opinion to learn from comrade Zhen Gongquan, calling on all provincial party members and cadres to study Zhen Gongquan's firm conviction, staunch support of the Party's spirit, service to the masses, straightforward dedication to the people, devotion to duty, abiding dedication, indifference to fame and fortune, selfless dedication to moral character and hardwork.]

• 1月16日，江西省委常委、赣州市委书记史文清将通过中国赣州网与网民在线交流，倾听网民意见、建议和诉求。[On January 16, Jiangxi Party Committee Member and Ganzhou City Party Secretary Shi Wenqing will communicate with netizens on the China Ganzhou Web, to hear comments, suggestions, and demands from netizens.]

(5) Cheerleading for China  Patriotism, encouragement and motivation, inspirational quotes and slogans, inspirational quotes from government officials, thankfulness, gratefulness, inspiration or thankfulness for historical and aspirational figures or events, and cultural references and celebrations (e.g., describes traditions, actions, suggestions for the community). Excludes positive sentiment toward particular government leaders or specific policies (which would be category (3)), but includes positive sentiment or general praise toward life, historical figures, model citizens (e.g., Lei Feng; Gong Quanzhen, a model teacher; Guo Chuhui, a patriotic villager), or China in general. Some examples of known Zhanggong 50c posts:

• 众多革命先烈们的英勇奋斗，缔造了我们今天的幸福生活！向英雄致敬。[Many revolutionary martyrs fought bravely to create the blessed life we have today! Respect these heroes.]
向所有为中华民族繁荣富强做出伟大贡献的先人们致敬！人民英雄永垂不朽 [Respect to all the people who have greatly contributed to the prosperity and success of the Chinese civilization! The heroes of the people are immortal]

接过父辈、祖辈血染的红旗，坚定不移地跟着党走！ [[I will] carry the red flag stained with the blood of our forefathers, and unswervingly follow the path of the CCP!]

我们自己要更加努力，不等不靠，主动上前。 [We all have to work harder, to rely on ourselves, and to take the initiative to move forward.]

爱我中华 [I love China]

大家的日子都过好了，中国梦就实现了！ [[If] everyone can live good lives, then the China Dream will be realized!]

赣州加油哦 [Way to go Ganzhou]

(6) Other  Irrelevant posts that are entirely personal, commercial (such as ads), jokes, or empty posts that forward information not included. This category is removed and conditioned on in all analyses in this article.

Appendix B  An Unintended “Survey” of the Chinese Government

We describe here a rare tacit confirmation of the existence of the 50c party, as well as an apparent admission to the accuracy of our leaked archive and the veracity of our empirical results, all unexpectedly offered by the Chinese government in response to our work.

Due to a set of unusual and unintended circumstances, an early draft of this article received considerable international attention, so much so that the Global Times wrote an editorial about it (this is a newspaper published by the People’s Daily, the CCP’s primary mouthpiece; see Wade 2016). Although this editorial is not an official statement of the Chinese government, it is reasonable to interpret it as a close approximation, or at worst of a faction, of the government. (We offer a translation of the editorial, along with a contextual explanation of its content, in the Supplementary Appendix to this paper.)

The main purpose of the editorial is to strongly defend the government’s unique system of public opinion guidance (see item 6 in Section 4). The editorial claims that “Chinese society is generally in agreement regarding the necessity of ‘public opinion guidance’” (其实对于“引导舆论”的必要性，中国社会总体是认同的). To understand

---

8We shared an early draft of this article privately with colleagues and others to solicit comments. We were in the process of revising when a reporter from a major international news outlet somehow obtained a copy and contacted us about publishing a story about it. We asked him to hold off because we had not finished revising, nor of course was it even under review yet. He refused, explaining that our results were too important and he did not want to be scooped by his journalistic competitors. Freedom of the press obviously gave us no recourse, and so we gave in, answered his questions, and posted the paper on our websites. Within a few days, over 5,000 news outlets across the globe published stories on our paper (according to Google news). The reporter who broke the story turned out to be right, as his next fastest competitor published only a few hours after he did, followed soon by many others.
the government’s position and perspective, it is helpful to use the viral discussion of our paper in social media, following its unexpected news coverage, to test the editorial’s claim. To do this, we downloaded posts from two sources, comments on the Global Times site and a broader sample from Weibo responding to the editorial. We used ReadMe, as above, to analyze each corpus separately.

We would expect more support for public opinion guidance from comments on a nationalist newspaper website, and much less support (than the regime acknowledges) from a more general population (consistent with Roberts, 2015). Indeed, this is just what we found. Our estimates indicate that 82% of the comments on the newspaper’s website which expressed an opinion supported China’s system of public opinion guidance (with 15% critical). Yet, among the likely broader audience found on Weibo, only 30% were supportive (with 63% critical), clearly contradicting the editorial’s rosy view of the government’s popularity.

The fact that the regime’s central strategy for controlling the dynamic and highly contested social media space lacks universal support likely makes the regime feel it all the more urgent to defend public opinion guidance in this forum. Authoritarian regimes like China, with strong international and military power, are usually focused on threats to their rule from their own people rather than, in this case, the international press (or scientific community). Confirming the following four points central to our article (as opposed to denying their previously surreptitious behavior) was of incidental relevance to government leaders but served the purpose of enabling them to engage the discussion and explicitly defend their information control practices.

First, although the Global Times has English and Chinese editions, with many articles published in both languages, the editorial about our paper was published only in Chinese. That is, even though it objected to how the story was covered in the international press, the CCP was primarily addressing its own people. This seems to be a regular strategy of the regime and is consistent with our interpretation of their main perceived threats being their own people rather than Western powers.

Second, the editorial appears to admit of the existence of the 50c party and at least tacitly confirms of the veracity of our leaked archive. They make these admissions apparently in order to turn the conversation into an explanation for their people about why public opinion guidance is essential. They also use the editorial to explain that traditional public opinion guidance is no longer sufficient to prevent the increase in viral messaging under control of those outside the government, which can spark or fuel collective action. Due to the rise of social media, the editorial says the government has “no choice” but to implement stronger information control practices designed for this new form of communication, such as 50c party activity. In other words, the 50c party exists but the Chinese people should not be focused on it.

Third, in a forum that regularly expresses opinions, including disapproval and disagreement, the editorial began with a summary of our empirical results, and took no issue with any of our conclusions.9 Thus, for all practical purposes, the editorial constitutes the

---

9The editorial did take one issue with our work (in addition to disagreeing with how the international press covered it), which was to imply that we had confused 50c party posts with those from other groups unauthorized by the Chinese government, but involved in similar activities. In fact, the only posts we analyzed and called 50c were those officially generated by the government. In case this was a misunderstanding, we clarify this point by adding what is now Footnote 2 to our paper.
answer to a simple sample survey question: That is, instead of asking 50c party members about their status as we do in Section 5, we (inadvertently) asked the Chinese government whether they agreed with our results, and they effectively concurred. Although social scientists often conduct interviews of individual public officials, we are grateful for the unusual, if not unprecedented, chance to pose questions to an organ of the Chinese government and have it respond, for all practical purposes, as a government, or at least in a way that represents it.

Finally, in the editorial, the government also acknowledges that the purpose of public opinion guidance is to constrain or stop the spread of “hot button issues” that go viral online or “grassroots social issues” that have collective action potential. This also confirms a central point of our work.
