

An Introduction to the Dataverse Network as an Infrastructure for Data Sharing

Gary King
Harvard University

March 21, 2007

Imagine scientific progress if ...

Imagine scientific progress if . . .

- To get a book, you must ask the author

Imagine scientific progress if . . .

- To get a book, you must ask the author
- You can read my book, only if you make me a coauthor of yours

Imagine scientific progress if . . .

- To get a book, you must ask the author
- You can read my book, only if you make me a coauthor of yours
- You can read my article, if you promise not to criticize me

Imagine scientific progress if . . .

- To get a book, you must ask the author
- You can read my book, only if you make me a coauthor of yours
- You can read my article, if you promise not to criticize me
- Titles change unpredictably, with no link to the old title

Imagine scientific progress if . . .

- To get a book, you must ask the author
- You can read my book, only if you make me a coauthor of yours
- You can read my article, if you promise not to criticize me
- Titles change unpredictably, with no link to the old title
- The few existing libraries use different titles and catalog numbers

Imagine scientific progress if . . .

- To get a book, you must ask the author
- You can read my book, only if you make me a coauthor of yours
- You can read my article, if you promise not to criticize me
- Titles change unpredictably, with no link to the old title
- The few existing libraries use different titles and catalog numbers
- Books are “corrected”; title and author don't change

Imagine scientific progress if . . .

- To get a book, you must ask the author
- You can read my book, only if you make me a coauthor of yours
- You can read my article, if you promise not to criticize me
- Titles change unpredictably, with no link to the old title
- The few existing libraries use different titles and catalog numbers
- Books are “corrected”; title and author don’t change
- Formal citations replaced with occasional casual mentions

Imagine scientific progress if . . .

- To get a book, you must ask the author
- You can read my book, only if you make me a coauthor of yours
- You can read my article, if you promise not to criticize me
- Titles change unpredictably, with no link to the old title
- The few existing libraries use different titles and catalog numbers
- Books are “corrected”; title and author don’t change
- Formal citations replaced with occasional casual mentions
- You can’t find articles I cite

Imagine scientific progress if . . .

- To get a book, you must ask the author
- You can read my book, only if you make me a coauthor of yours
- You can read my article, if you promise not to criticize me
- Titles change unpredictably, with no link to the old title
- The few existing libraries use different titles and catalog numbers
- Books are “corrected”; title and author don’t change
- Formal citations replaced with occasional casual mentions
- You can’t find articles I cite
- Periodically books are translated to new languages; original is destroyed

Imagine scientific progress if . . .

- To get a book, you must ask the author
- You can read my book, only if you make me a coauthor of yours
- You can read my article, if you promise not to criticize me
- Titles change unpredictably, with no link to the old title
- The few existing libraries use different titles and catalog numbers
- Books are “corrected”; title and author don’t change
- Formal citations replaced with occasional casual mentions
- You can’t find articles I cite
- Periodically books are translated to new languages; original is destroyed
- *How much less would we know about the world?*

Imagine scientific progress if . . .

- To get a book, you must ask the author
- You can read my book, only if you make me a coauthor of yours
- You can read my article, if you promise not to criticize me
- Titles change unpredictably, with no link to the old title
- The few existing libraries use different titles and catalog numbers
- Books are “corrected”; title and author don’t change
- Formal citations replaced with occasional casual mentions
- You can’t find articles I cite
- Periodically books are translated to new languages; original is destroyed
- *How much less would we know about the world?*
- **For articles and books, this is FICTION**

Imagine scientific progress if . . .

- To get a book, you must ask the author
- You can read my book, only if you make me a coauthor of yours
- You can read my article, if you promise not to criticize me
- Titles change unpredictably, with no link to the old title
- The few existing libraries use different titles and catalog numbers
- Books are “corrected”; title and author don’t change
- Formal citations replaced with occasional casual mentions
- You can’t find articles I cite
- Periodically books are translated to new languages; original is destroyed
- *How much less would we know about the world?*
- For articles and books, this is FICTION
- For quantitative data, this is FACT

Infrastructure for Quantitative Data

Infrastructure for Quantitative Data

- Most large data sets: in public archives

Infrastructure for Quantitative Data

- Most large data sets: in public archives
- Data used in most published articles: not publicly available

Infrastructure for Quantitative Data

- Most large data sets: in public archives
- Data used in most published articles: not publicly available
- Most articles cannot be replicated without the original author

Infrastructure for Quantitative Data

- Most large data sets: in public archives
- Data used in most published articles: not publicly available
- Most articles cannot be replicated without the original author
- Most data sets from NSF & NIH grants: not publicly available

Infrastructure for Quantitative Data

- Most large data sets: in public archives
- Data used in most published articles: not publicly available
- Most articles cannot be replicated without the original author
- Most data sets from NSF & NIH grants: not publicly available
- Recently, a major archive renumbered all its acquisitions

Infrastructure for Quantitative Data

- Most large data sets: in public archives
- Data used in most published articles: not publicly available
- Most articles cannot be replicated without the original author
- Most data sets from NSF & NIH grants: not publicly available
- Recently, a major archive renumbered all its acquisitions
- Data in different archives have different identifiers

Infrastructure for Quantitative Data

- Most large data sets: in public archives
- Data used in most published articles: not publicly available
- Most articles cannot be replicated without the original author
- Most data sets from NSF & NIH grants: not publicly available
- Recently, a major archive renumbered all its acquisitions
- Data in different archives have different identifiers
- Changes to data are made; identifiers are reused or deaccessioned; old data are lost

Infrastructure for Quantitative Data

- Most large data sets: in public archives
- Data used in most published articles: not publicly available
- Most articles cannot be replicated without the original author
- Most data sets from NSF & NIH grants: not publicly available
- Recently, a major archive renumbered all its acquisitions
- Data in different archives have different identifiers
- Changes to data are made; identifiers are reused or deaccessioned; old data are lost
- When storage methods changes, some data sets are lost; others have altered content!

The Point of Data Access

The Point of Data Access

The Key to Science

The Key to Science

- Science is not (only) about being scientific

The Key to Science

- Science is not (only) about being scientific
- Scientific progress requires community: Competition and cooperation in the pursuit of common goals

The Key to Science

- Science is not (only) about being scientific
- Scientific progress requires community: Competition and cooperation in the pursuit of common goals
- Without access to the same materials: no community exists

The Key to Science

- Science is not (only) about being scientific
- Scientific progress requires community: Competition and cooperation in the pursuit of common goals
- Without access to the same materials: no community exists
- Value of an article that can't be replicated: ?

The Point of Data Access

The Key to Science

- Science is not (only) about being scientific
- Scientific progress requires community: Competition and cooperation in the pursuit of common goals
- Without access to the same materials: no community exists
- Value of an article that can't be replicated: ?

The Key to Democracy

The Point of Data Access

The Key to Science

- Science is not (only) about being scientific
- Scientific progress requires community: Competition and cooperation in the pursuit of common goals
- Without access to the same materials: no community exists
- Value of an article that can't be replicated: ?

The Key to Democracy

- Statistics = **state**-istics

The Point of Data Access

The Key to Science

- Science is not (only) about being scientific
- Scientific progress requires community: Competition and cooperation in the pursuit of common goals
- Without access to the same materials: no community exists
- Value of an article that can't be replicated: ?

The Key to Democracy

- Statistics = **state**-istics
- for government: taxing requires counting counting people, estimating wealth

The Point of Data Access

The Key to Science

- Science is not (only) about being scientific
- Scientific progress requires community: Competition and cooperation in the pursuit of common goals
- Without access to the same materials: no community exists
- Value of an article that can't be replicated: ?

The Key to Democracy

- Statistics = **state**-istics
- for government: taxing requires counting counting people, estimating wealth
- for people: Reformers use data to get the goods on the state

The Point of Data Access

The Key to Science

- Science is not (only) about being scientific
- Scientific progress requires community: Competition and cooperation in the pursuit of common goals
- Without access to the same materials: no community exists
- Value of an article that can't be replicated: ?

The Key to Democracy

- Statistics = **state**-istics
- for government: taxing requires counting counting people, estimating wealth
- for people: Reformers use data to get the goods on the state
- In modern democracy: the public needs a direct source of information

What About a Centralized Data Access Solution?

What About a Centralized Data Access Solution?

- Highly desirable when feasible

What About a Centralized Data Access Solution?

- Highly desirable when feasible
- Works great in genomics, astronomy, etc., when data formats are universal, goals are common, and agreements are in place

What About a Centralized Data Access Solution?

- Highly desirable when feasible
- Works great in genomics, astronomy, etc., when data formats are universal, goals are common, and agreements are in place
- **Impossible** when data are heterogeneous in format, origin, size, effort needed to collect or analyze, IRB access rules, etc.

What About a Centralized Data Access Solution?

- Highly desirable when feasible
- Works great in genomics, astronomy, etc., when data formats are universal, goals are common, and agreements are in place
- **Impossible** when data are heterogeneous in format, origin, size, effort needed to collect or analyze, IRB access rules, etc.
- Why not put data in public archives?

What About a Centralized Data Access Solution?

- Highly desirable when feasible
- Works great in genomics, astronomy, etc., when data formats are universal, goals are common, and agreements are in place
- **Impossible** when data are heterogeneous in format, origin, size, effort needed to collect or analyze, IRB access rules, etc.
- Why not put data in public archives?
 - Researchers infrequently use archives

What About a Centralized Data Access Solution?

- Highly desirable when feasible
- Works great in genomics, astronomy, etc., when data formats are universal, goals are common, and agreements are in place
- **Impossible** when data are heterogeneous in format, origin, size, effort needed to collect or analyze, IRB access rules, etc.
- Why not put data in public archives?
 - Researchers infrequently use archives
 - They worry about the Archive getting all the credit

What About a Centralized Data Access Solution?

- Highly desirable when feasible
- Works great in genomics, astronomy, etc., when data formats are universal, goals are common, and agreements are in place
- **Impossible** when data are heterogeneous in format, origin, size, effort needed to collect or analyze, IRB access rules, etc.
- Why not put data in public archives?
 - Researchers infrequently use archives
 - They worry about the Archive getting all the credit
 - Upon questioning: they want credit, control, and visibility

What About a Centralized Data Access Solution?

- Highly desirable when feasible
- Works great in genomics, astronomy, etc., when data formats are universal, goals are common, and agreements are in place
- **Impossible** when data are heterogeneous in format, origin, size, effort needed to collect or analyze, IRB access rules, etc.
- Why not put data in public archives?
 - Researchers infrequently use archives
 - They worry about the Archive getting all the credit
 - Upon questioning: they want credit, control, and visibility
 - (So why don't they worry about print publishers getting all the credit?)

What About a Centralized Data Access Solution?

- Highly desirable when feasible
- Works great in genomics, astronomy, etc., when data formats are universal, goals are common, and agreements are in place
- **Impossible** when data are heterogeneous in format, origin, size, effort needed to collect or analyze, IRB access rules, etc.
- Why not put data in public archives?
 - Researchers infrequently use archives
 - They worry about the Archive getting all the credit
 - Upon questioning: they want credit, control, and visibility
 - (So why don't they worry about print publishers getting all the credit? Lack of data citations!)

What About a Centralized Data Access Solution?

- Highly desirable when feasible
- Works great in genomics, astronomy, etc., when data formats are universal, goals are common, and agreements are in place
- **Impossible** when data are heterogeneous in format, origin, size, effort needed to collect or analyze, IRB access rules, etc.
- Why not put data in public archives?
 - Researchers infrequently use archives
 - They worry about the Archive getting all the credit
 - Upon questioning: they want credit, control, and visibility
 - (So why don't they worry about print publishers getting all the credit? Lack of data citations!)
- We will propose technological solutions to these political and sociological problems

Requirements for Effective Data Sharing Infrastructure

Requirements for Effective Data Sharing Infrastructure

- **Recognition**, for authors, journals, etc. in (1) citations to data, (2) citations to articles, and (3) visibility on the web.

Requirements for Effective Data Sharing Infrastructure

- **Recognition**, for authors, journals, etc. in (1) citations to data, (2) citations to articles, and (3) visibility on the web.
- **Public Distribution**, without permission from the author

Requirements for Effective Data Sharing Infrastructure

- **Recognition**, for authors, journals, etc. in (1) citations to data, (2) citations to articles, and (3) visibility on the web.
- **Public Distribution**, without permission from the author
- **Authorization**: fulfill requirements the author originally met

Requirements for Effective Data Sharing Infrastructure

- **Recognition**, for authors, journals, etc. in (1) citations to data, (2) citations to articles, and (3) visibility on the web.
- **Public Distribution**, without permission from the author
- **Authorization**: fulfill requirements the author originally met
- **Validation**: check that data exists, without authorization

Requirements for Effective Data Sharing Infrastructure

- **Recognition**, for authors, journals, etc. in (1) citations to data, (2) citations to articles, and (3) visibility on the web.
- **Public Distribution**, without permission from the author
- **Authorization**: fulfill requirements the author originally met
- **Validation**: check that data exists, without authorization
- **Verification** that data associated with an article is unchanged into the future, and even if converted

Requirements for Effective Data Sharing Infrastructure

- **Recognition**, for authors, journals, etc. in (1) citations to data, (2) citations to articles, and (3) visibility on the web.
- **Public Distribution**, without permission from the author
- **Authorization**: fulfill requirements the author originally met
- **Validation**: check that data exists, without authorization
- **Verification** that data associated with an article is unchanged into the future, and even if converted from SPSS to Stata to R,

Requirements for Effective Data Sharing Infrastructure

- **Recognition**, for authors, journals, etc. in (1) citations to data, (2) citations to articles, and (3) visibility on the web.
- **Public Distribution**, without permission from the author
- **Authorization**: fulfill requirements the author originally met
- **Validation**: check that data exists, without authorization
- **Verification** that data associated with an article is unchanged into the future, and even if converted from SPSS to Stata to R, from a PC to a Mac to Linux,

Requirements for Effective Data Sharing Infrastructure

- **Recognition**, for authors, journals, etc. in (1) citations to data, (2) citations to articles, and (3) visibility on the web.
- **Public Distribution**, without permission from the author
- **Authorization**: fulfill requirements the author originally met
- **Validation**: check that data exists, without authorization
- **Verification** that data associated with an article is unchanged into the future, and even if converted from SPSS to Stata to R, from a PC to a Mac to Linux, and from 8 inch magnetic tape to 5.25 inch floppies to a DVD.

Requirements for Effective Data Sharing Infrastructure

- **Recognition**, for authors, journals, etc. in (1) citations to data, (2) citations to articles, and (3) visibility on the web.
- **Public Distribution**, without permission from the author
- **Authorization**: fulfill requirements the author originally met
- **Validation**: check that data exists, without authorization
- **Verification** that data associated with an article is unchanged into the future, and even if converted from SPSS to Stata to R, from a PC to a Mac to Linux, and from 8 inch magnetic tape to 5.25 inch floppies to a DVD.
- **Persistence** Decades from now. . . .

Requirements for Effective Data Sharing Infrastructure

Special indentation

Rules for Citing Printed Matter

Kim, Jae-On, Norman Nie, and Sidney Verba. 1977. "A Note on Factor Analyzing Dichotomous Variables: The Case of Political Participation," Political Methodology, Vol. 4: No. 2 (Spring): Pp. 39–62.

Citations: rule-based, precise, redundant

Rules for Citing Printed Matter

Kim, Jae-On, Norman Nie, and Sidney Verba. 1977. "A Note on Factor Analyzing Dichotomous Variables: The Case of Political Participation," Political Methodology, Vol. 4: No. 2 (Spring): Pp. 39–62.

Print Citations Work: authors don't think publishers get all the credit; cited articles can be found; copyeditors don't need to see the original to know it exists; the link from citation to print persists

Advantages of UNFs

Advantages of UNFs

- UNF is **calculated from the content** not the file:

.

Advantages of UNFs

- UNF is **calculated from the content** not the file: Its the **Same UNF** regardless of changes in computer hardware,

.

Advantages of UNFs

- UNF is **calculated from the content** not the file: Its the **Same UNF** regardless of changes in computer hardware, storage medium,

.

Advantages of UNFs

- UNF is **calculated from the content** not the file: Its the **Same UNF** regardless of changes in computer hardware, storage medium, operating system,

Advantages of UNFs

- UNF is **calculated from the content** not the file: Its the **Same UNF** regardless of changes in computer hardware, storage medium, operating system, statistical software,

Advantages of UNFs

- UNF is **calculated from the content** not the file: Its the **Same UNF** regardless of changes in computer hardware, storage medium, operating system, statistical software, database,

Advantages of UNFs

- UNF is **calculated from the content** not the file: Its the **Same UNF** regardless of changes in computer hardware, storage medium, operating system, statistical software, database, or spreadsheet software.

Advantages of UNFs

- UNF is **calculated from the content** not the file: Its the **Same UNF** regardless of changes in computer hardware, storage medium, operating system, statistical software, database, or spreadsheet software.
- Cryptographic technology: **any** change in data content changes the UNF. (no tinkering after the fact!)

Advantages of UNFs

- UNF is **calculated from the content** not the file: Its the **Same UNF** regardless of changes in computer hardware, storage medium, operating system, statistical software, database, or spreadsheet software.
- Cryptographic technology: **any** change in data content changes the UNF. (no tinkering after the fact!)
- Noninvertible properties

Advantages of UNFs

- UNF is **calculated from the content** not the file: Its the **Same UNF** regardless of changes in computer hardware, storage medium, operating system, statistical software, database, or spreadsheet software.
- Cryptographic technology: **any** change in data content changes the UNF. (no tinkering after the fact!)
- Noninvertible properties
 - UNFs convey no information about data content

Advantages of UNFs

- UNF is **calculated from the content** not the file: Its the **Same UNF** regardless of changes in computer hardware, storage medium, operating system, statistical software, database, or spreadsheet software.
- Cryptographic technology: **any** change in data content changes the UNF. (no tinkering after the fact!)
- Noninvertible properties
 - UNFs convey no information about data content
 - OK to distribute for highly sensitive, confidential, or proprietary data

Advantages of UNFs

- UNF is **calculated from the content** not the file: Its the **Same UNF** regardless of changes in computer hardware, storage medium, operating system, statistical software, database, or spreadsheet software.
- Cryptographic technology: **any** change in data content changes the UNF. (no tinkering after the fact!)
- Noninvertible properties
 - UNFs convey no information about data content
 - OK to distribute for highly sensitive, confidential, or proprietary data
 - Copyeditor can validate data's existence even without authorization

Advantages of UNFs

[Data](#)
[Research Group](#)
[Class Materials](#)
[Links](#)
[Contact](#)

Gary King is the David Florence Professor of Government in the [Department of Government](#) (in the [Faculty of Arts and Sciences Harvard University](#)). He also serves as Director of the [Institute for Quantitative Social Science](#). King and his [research group](#) develop statistical and other methods for, and conduct diverse applications in, many areas of social science research, focusing on innovations that span the range from statistical theory to practical application. For more information, see his [short bio](#) and [curriculum vitae](#).

King's work can be found categorized by type ([recent writings](#), published [articles](#) and [books](#), public [presentations](#), and [software](#)) alternatively by research areas:

- **Causal Inference:** Methods for detecting and reducing model dependence (when minor model changes produce substantively different inferences) in inferring counterfactuals (such as predictions, what-if questions, and causal effects). Matching methods; "politically robust" experimental design; a causal bias decomposition; software; and applications.
- **Data Sharing and Informatics:** New standards, protocols, and software for citing, sharing, analyzing, archiving, preserving, distributing, cataloging, translating, disseminating, naming, verifying, and replicating quantitative data and associated analyses. Also includes proposals to improve the norms of data sharing and replication in science.
- **Ecological Inference** (Inferring Individual Behavior from Group-Level Data): The original methods that incorporate both unit-level deterministic bounds and cross-unit statistical information, methods for 2x2 and larger tables, Bayesian model averaging, and applications to elections, EI/EzI software.
- **Event Counts and Duration Models:** Develops statistical models to explain how many events occur for each fixed time period between events. An application to cabinet dissolution in parliamentary democracies united two previously warring scholarly literatures. Other applications in international relations, and Supreme Court appointments.

RECENT PAPERS

[Preprints And Works In Progress](#)

(Papers appearing here that have not yet been published will likely change frequently; any [comments](#) you might have would be appreciated.)

- An Introduction to the Dataverse Network as an Infrastructure for Data Sharing** by Gary King. Version: 2/26/07. (Paper: [PDF](#)) We introduce a set of integrated developments in web application software, networking, data citation standards, and statistical methods designed to put some of the universe of data and data sharing practices on somewhat firmer ground. We have focused on social science data, but aspects of what we have developed may apply more widely. The idea is to facilitate the public dissemination of persistent, authorized, and verifiable data, with powerful but easy-to-use technology, even when the data are confidential or proprietary. We intend to solve some of the sociological problems of data sharing via technological means, with the result to benefit both the scientific community and the sometimes apparently contradictory goals of individual researchers.
- Misunderstandings among Experimentalists and Observationalists: Balance Test Fallacies in Causal Inference** by Imai, Gary King, and Elizabeth Stuart. Version: 1/7/07 (Paper: [PDF](#)) We attempt to clarify, and show how to avoid, several common fallacies of causal inference in experimental and observational studies. These fallacies concern hypothesis tests for covariate balance between the treated and control groups, and the consequences of using randomization, blocking before randomization, and matching after treatment assignment to achieve balance. Applied researchers in a wide range of scientific disciplines seem to prey to one or more of these fallacies. To clarify these points, we derive a new three-part decomposition of the potential estimation errors in making causal inferences. We then show how this decomposition can help scholars from different experimental and observational research traditions better understand each other's inferential problems and attempted solutions. We illustrate with a discussion of the misleading conclusions researchers produce when using hypothesis tests to check for balance in experiments and observational studies.
- A 'Politically Robust' Experimental Design for Public Policy Evaluation, with Application to the Mexican Universal Insurance Program**, by Gary King, Emmanuela Gakidou, Nirmala Ravishanker, Ryan T. Moore, Jason Lakin, Manett Vargas, María Téllez-Rojo, Juan Eugenio Hernández Ávila, Mauricio Hernández Ávila, and Héctor Hernández Llamas. Version: 1/24/07 (Paper: [PDF](#)). We develop an approach to conducting large scale randomized public policy experiments intended to be more robust to the political interventions that have ruined some or all parts of many similar previous efforts. Our proposed design is inspired by the work of randomized controlled trials in medicine and agriculture.

The Dataverse Network Project Homepage (<http://TheData.org>)

Dataverse Networks may harvest metadata from each other (dashed lines)

Dataverse owners may list, or allow searching across, other dataverses or the data sets in them

Each Dataverse Network may serve numerous individual dataverses (arrows)

Most users come directly to a dataverse, which is a self-contained archive (with all services provided by a Dataverse Network)

Software is available at the project homepage and only needs to be installed to establish a Dataverse Network. Dataverses are virtual hosts.

Your Own Dataverse

Your Own Dataverse

- **Full service virtual archive**, with numerous data services (citation, metadata, archiving, subsetting, conversion, translation, analysis, ...)

Your Own Dataverse

- **Full service virtual archive**, with numerous data services (citation, metadata, archiving, subsetting, conversion, translation, analysis, ...)
- **Hierarchically organized** collection of data sets on chosen subjects; your view of the universe of data

- DataPass Preservation and Cataloging Collaboration, under Library of Congress auspices, among
 - ICPSR (U Michigan), Odum Institute (UNC), Roper Center (UConn), NARA, HMDC, Murray
- Dataverses and Dataverse Networks now being installed elsewhere

The Universe of Data meets the Universe of Methods

The Universe of Data meets the Universe of Methods

- R Project for Statistical Computing

The Universe of Data meets the Universe of Methods

- R Project for Statistical Computing
 - nearly 1000 packages; most new methods appear in R first

- **R Project for Statistical Computing**
 - nearly 1000 packages; most new methods appear in R first
 - Highly diverse examples, syntax, documentation, and quality

- **R Project for Statistical Computing**
 - nearly 1000 packages; most new methods appear in R first
 - Highly diverse examples, syntax, documentation, and quality
 - Difficult for statistics-types; harder for applied researchers

The Universe of Data meets the Universe of Methods

- **R Project for Statistical Computing**
 - nearly 1000 packages; most new methods appear in R first
 - Highly diverse examples, syntax, documentation, and quality
 - Difficult for statistics-types; harder for applied researchers
- **Zelig: Everyone's Statistical Software**

The Universe of Data meets the Universe of Methods

- **R Project for Statistical Computing**
 - nearly 1000 packages; most new methods appear in R first
 - Highly diverse examples, syntax, documentation, and quality
 - Difficult for statistics-types; harder for applied researchers
- **Zelig: Everyone's Statistical Software**
 - An ontology we developed of almost all statistical methods

The Universe of Data meets the Universe of Methods

- **R Project for Statistical Computing**
 - nearly 1000 packages; most new methods appear in R first
 - Highly diverse examples, syntax, documentation, and quality
 - Difficult for statistics-types; harder for applied researchers
- **Zelig: Everyone's Statistical Software**
 - An ontology we developed of almost all statistical methods
 - Users incorporate original packages via simple bridge functions via a simple model description language

- **R Project for Statistical Computing**
 - nearly 1000 packages; most new methods appear in R first
 - Highly diverse examples, syntax, documentation, and quality
 - Difficult for statistics-types; harder for applied researchers
- **Zelig: Everyone's Statistical Software**
 - An ontology we developed of almost all statistical methods
 - Users incorporate original packages via simple bridge functions via a simple model description language
 - Result: Unified Syntax, the same 3 commands to use any method

The Universe of Data meets the Universe of Methods

- **R Project for Statistical Computing**

- nearly 1000 packages; most new methods appear in R first
- Highly diverse examples, syntax, documentation, and quality
- Difficult for statistics-types; harder for applied researchers

- **Zelig: Everyone's Statistical Software**

- An ontology we developed of almost all statistical methods
- Users incorporate original packages via simple bridge functions via a simple model description language
- Result: Unified Syntax, the same 3 commands to use any method
- Automatically generated Graphical User Interface with all the world's methods

The Universe of Data meets the Universe of Methods

 - An ontology we developed of almost all statistical methods
 - Users incorporate original packages via simple bridge functions via a simple model description language
 - Result: Unified Syntax, the same 3 commands to use any method
 - Automatically generated Graphical User Interface with all the world's methods
- **R + Zelig + Dataverse Network**
 - Greatly reduced time from methods development to use

The Universe of Data meets the Universe of Methods

- **R Project for Statistical Computing**

- nearly 1000 packages; most new methods appear in R first
- Highly diverse examples, syntax, documentation, and quality
- Difficult for statistics-types; harder for applied researchers

- **Zelig: Everyone's Statistical Software**

- An ontology we developed of almost all statistical methods
- Users incorporate original packages via simple bridge functions via a simple model description language
- Result: Unified Syntax, the same 3 commands to use any method
- Automatically generated Graphical User Interface with all the world's methods

- **R + Zelig + Dataverse Network**

- Greatly reduced time from methods development to use
- Easy for applied researchers even if non-programmers

- Web application software

- Web application software
 - Pros: easy to use, no installation costs

- Web application software
 - Pros: easy to use, no installation costs
 - Cons: the software can vanish or change at any time

- Web application software
 - Pros: easy to use, no installation costs
 - Cons: the software can vanish or change at any time
- Dataverse Network Software

- Web application software
 - Pros: easy to use, no installation costs
 - Cons: the software can vanish or change at any time
- Dataverse Network Software
 - GNU 3.0 License

- Web application software
 - Pros: easy to use, no installation costs
 - Cons: the software can vanish or change at any time
- Dataverse Network Software
 - GNU 3.0 License
 - Open source, public ownership

- Web application software
 - Pros: easy to use, no installation costs
 - Cons: the software can vanish or change at any time
- Dataverse Network Software
 - GNU 3.0 License
 - Open source, public ownership
 - If you don't like the new version: you can make a new one

- Web application software
 - Pros: easy to use, no installation costs
 - Cons: the software can vanish or change at any time
- Dataverse Network Software
 - GNU 3.0 License
 - Open source, public ownership
 - If you don't like the new version: you can make a new one
 - You own the software & the underlying code

- Web application software
 - Pros: easy to use, no installation costs
 - Cons: the software can vanish or change at any time
- Dataverse Network Software
 - GNU 3.0 License
 - Open source, public ownership
 - If you don't like the new version: you can make a new one
 - You own the software & the underlying code
 - The license guarantees that this will remain true in the future

Possible Future Directions

Possible Future Directions

- Begin campaign to sign up authors, journals, for dataverses (personal contact required)

Possible Future Directions

- Begin campaign to sign up authors, journals, for dataverses (personal contact required)
- Campaign to install Dataverse Network software elsewhere

Possible Future Directions

- Begin campaign to sign up authors, journals, for dataverses (personal contact required)
- Campaign to install Dataverse Network software elsewhere
- Establish (or beef up existing) archives to hold all the data

Possible Future Directions

- Begin campaign to sign up authors, journals, for dataverses (personal contact required)
- Campaign to install Dataverse Network software elsewhere
- Establish (or beef up existing) archives to hold all the data
- Add more data services: makes including data more attractive

Possible Future Directions

- Begin campaign to sign up authors, journals, for dataverses (personal contact required)
- Campaign to install Dataverse Network software elsewhere
- Establish (or beef up existing) archives to hold all the data
- Add more data services: makes including data more attractive
 - Spatially enabling data

Possible Future Directions

- Begin campaign to sign up authors, journals, for dataverses (personal contact required)
- Campaign to install Dataverse Network software elsewhere
- Establish (or beef up existing) archives to hold all the data
- Add more data services: makes including data more attractive
 - Spatially enabling data
 - Include more models in Zelig, and thus in Dataverse

Possible Future Directions

- Begin campaign to sign up authors, journals, for dataverses (personal contact required)
- Campaign to install Dataverse Network software elsewhere
- Establish (or beef up existing) archives to hold all the data
- Add more data services: makes including data more attractive
 - Spatially enabling data
 - Include more models in Zelig, and thus in Dataverse
 - Link to more existing data providers

Possible Future Directions

- Begin campaign to sign up authors, journals, for dataverses (personal contact required)
- Campaign to install Dataverse Network software elsewhere
- Establish (or beef up existing) archives to hold all the data
- Add more data services: makes including data more attractive
 - Spatially enabling data
 - Include more models in Zelig, and thus in Dataverse
 - Link to more existing data providers
 - More data conversion options

Possible Future Directions

- Begin campaign to sign up authors, journals, for dataverses (personal contact required)
- Campaign to install Dataverse Network software elsewhere
- Establish (or beef up existing) archives to hold all the data
- Add more data services: makes including data more attractive
 - Spatially enabling data
 - Include more models in Zelig, and thus in Dataverse
 - Link to more existing data providers
 - More data conversion options
 - Implement Unicode so Dataverse can operate in many languages

Possible Future Directions

- Begin campaign to sign up authors, journals, for dataverses (personal contact required)
- Campaign to install Dataverse Network software elsewhere
- Establish (or beef up existing) archives to hold all the data
- Add more data services: makes including data more attractive
 - Spatially enabling data
 - Include more models in Zelig, and thus in Dataverse
 - Link to more existing data providers
 - More data conversion options
 - Implement Unicode so Dataverse can operate in many languages
 - Many back end technical developments

Possible Future Directions

- Begin campaign to sign up authors, journals, for dataverses (personal contact required)
- Campaign to install Dataverse Network software elsewhere
- Establish (or beef up existing) archives to hold all the data
- Add more data services: makes including data more attractive
 - Spatially enabling data
 - Include more models in Zelig, and thus in Dataverse
 - Link to more existing data providers
 - More data conversion options
 - Implement Unicode so Dataverse can operate in many languages
 - Many back end technical developments
- Result: Massive increase publicly available data

Cutting Edge Technology used in DVN Software

- Written in Java Enterprise Edition 5 (team picked for JavaOne)
- Enterprise JavaBeans 3.0 to manage software components
- JavaServer Faces for building the user interface
- Builds on other open source components:
 - GlassFish application server (wrote press release on our project)
 - R for statistical computing
 - Zelig simplifies R and encompasses many statistical methods
 - Apache Lucene for an index server and search engine
 - PostgreSQL as a database
 - Shale Tile and Tiles 2 for our user interface framework
 - Awstats for web statistics
 - OAI Cat and OAIHarvester2 for harvesting data and metadata
 - The Handle System for persistent identifiers
